PREFACE.

Some explanation may be necessary for the publication of an essay on the antiquity of the Vedas by one whose professional work lies in a different direction. About four years ago, as I was reading the Bhagavad Gitâ, it occurred to me that we might derive important conclusions from the statement of Krishna that "he was Margashirsha of the months." This led me to inquire into the primitive Vedic calendar, and the result of four years' labour is now placed before the public. The essay was originally written for the Ninth Oriental Congress held in London last year. But it was found too large to be inserted in the proceedings wherein its summary alone is now included. I have had therefore to publish it separately, and in doing so I have taken the opportunity of incorporating into it such additions, alterations and modifications, as were suggested by further thought and discussion.

The chief result of my inquiry would be evident from the title of the essay. The high antiquity of the Egyptian civilization is now generally admitted. But scholars still hesitate to place the commencement of the Vedic civilization earlier than 2400 B.C. I have endeavoured to show in the following pages that the traditions recorded in the Rigveda unmistakably point to a period not later than 4000 B.C., when the vernal equinox was in Orion, or, in other words, when the Dog-star (or the Dog as we have it in the Rigveda) commenced the equinoctial year. Many of the Vedic texts and legends, quoted in support of this conclusion, have been cited in this connection and also rationally and intelligently explained for the first time, thus throwing

a considerable light on the legends and rites in later Sanskrit works. I have further tried to show how these legends are strikingly corroborated by the legends and traditions of Iran and Greece. Perhaps some of this corroborative evidence may not be regarded as sufficiently conclusive by itself, but in that case I hope it will be borne in mind that my conclusions are not based merely upon mythological or philological coincidences, and if some of these are disputable, they do not in any way shake the validity of the conclusions based on the express texts and references scattered over the whole Vedic literature. I wanted to collect together all the facts that could possibly throw any light upon, or be shown to be connected with the question in issue, and if in so doing I have mentioned some, that are not as convincing as the others, I am sure that they will at least be found interesting, and that even after omitting them there will be ample evidence to establish the main point. I have, therefore, to request my critics not to be prejudiced by such facts, and to examine and weigh the whole evidence I have adduced in support of my theory before they give their judgment upon it.

I have tried to make the book as little technical as possible; but I am afraid that those who are not acquainted with the Hindu method of computing time may still find it somewhat difficult to follow the argument in a few places. If my conclusions come to be accepted and the second edition of the book be called for, these defects may be removed by adding further explanations in such cases. At present I have only attempted to give the main argument on the assumption that the reader is already familiar with the method. I may further remark that though I have

used the atronomical method, yet a comparison with Bentley's work will show that the present essay is more literary than astronomical in its character. In other words, it is the Sanskrit scholars who have first of all to decide if my interpretations of certain texts are correct, and when this judgment is once given it is not at all difficult to astronomically calculate the exact period of the traditions in the Rigveda. I do not mean to say that no knowledge of astronomy is necessary to discuss the subject, but on the whole it would be readily seen that the question is one more for Sanskrit scholars than for astronomers to decide.

Some scholars may doubt the possibility of deriving so important and far-reaching conclusions from the data furnished by the hymns of the Rigveda, and some may think that I am taking the antiquity of the Vedas too far back. But fears like these are out of place in a historical or scientific inquiry, the sole object of which should be to search for and find out the truth. The method of investigation followed by me is the same as that adopted by Bentley, Colebrooke and other well-known writers on the subject, and, in my opinion, the only question that Sanskrit scholars have now to decide, is whether I am or am not justified in carrying it a step further than my predecessors, independently of any modifications that may be thereby made necessary in the existing hypothesis on the subject.

I have omitted to mention in the essay that a few native scholars have tried to ascertain the date of the Mahâbhârata, and the Râmâyaṇa from certain positions of the sun, the moon and the planets given in those works. For instance, the horoscope of Râma and the positions of the planets at the time of the great civil war, as found in the Mahâbhârata,

are said to point to a period of 5000 or 6000 B. C., and it is contended that the Vedas which preceded these works must be older still. Bentley relying on the same date has calculated 961 B. C. as the exact date of Râma's birth. This will show how unsafe it is to act upon calculations based upon such loose statements. Sometimes the accounts in the Purânas are themselves conflicting, but even where they are or can be made definite any conclusions based on them are not only doubtful, but well nigh useless for chronological purposes, for in the first instance they are open to the objection that these works may not have been written by eye-witnesses (the mention Râshis in the Râmâyana directly supporting such an assumption), and secondly, because it is still more difficult to prove that we now possess these books in the form in which they were originally written. With regard to the positions of the planets at the time of the war given in the Mahâbhârata, the statements are undoubtedly confused; but apart from it, I think that it is almost a gratuitous assumption to hold that all of them really give us the positions of the planets in the ecliptic and that such positions again refer to the fixed and the moveable zodiacal portions of the Nakshatras. Perhaps the writers simply intend to mention all auspicious or inauspicious positions of the planets in such cases. I have therefore avoided all such debatable and doubtful points by confining myself solely to the Vedic works, about the genuineness of which there can be no doubt, and using the Purânic accounts only to corroborate the results deduced from the Vedic texts. According to this view the Mahâbhârata war must be placed in the Krittika period, inasmuch as we are told that Bhishma was waiting for the turning of the sun from the winter solstice in the month

of Magha. The poem, as we now have it, is evidently written a long time after this event.

Lastly, I have to express my obligations to several friends for encouraging me to carry on the inquiry and helping me in one way or another to complete this essay. My special thanks are however due to Dr. Râmkrishna Gopâl Bhândar-kar, who kindly undertook to explain to me the views of German scholars in regard to certain passages from the Rigveda, and to Khan Bahadur Dr. Dastur Hoshang Jamasp for the ready assistance he gave in supplying information contained in the original Parsi sacred books. I am also greatly indebted to Prof. Max Müller for some valuable suggestions and critical comments on the etymological evidence contained in the essay. I am, however, alone responsible for all the views, suggestions, and statements made in the following pages.

With these remarks I leave the book in the hands of critics, fully relying upon the saying of the poet—

हेम्नः संलक्ष्यते ह्यग्री विद्याद्धिः र्यामिकाऽपि वा।

"The fineness or the darkness of gold is best tested in fire." It is not likely that my other engagements will permit me to devote much time to this subject in future; and I shall consider myself well rewarded if the present essay does in any way contribute to a fuller and unprejudiced discussion of the high antiquity of the Aryan civilization, of which our sacred books are the oldest records in the world.

THE ORION

OR

Researches into the Antiquity of the Vedas.

---:0:---

CHAPTER I.

INTRODUCTION.

Importance of ascertaining the Age of the Vedas—Linguistic method— Its defects—Astronomical method—Its difficulties unduly magnified—Views of European and Native scholars examined.

THE VEDA is the oldest of the books that we now possess, and it is generally admitted "that for a study of man, or if you like, for a study of Aryan humanity, there is nothing in the world equal in importance with it." There is no other book which carries us so nar the beginning of the Aryan civilization, if not the absolute beginning of all things, as maintained by the Hindu theologiaus; and the importance of ascertaining even approximately the age when the oldest of the Vedic Rishis, like the classical Valmiki, may have been inspired to unconsciously give utterance to a Vedic verse, cannot therefore be overrated. The birth of Gautama Buddha, the invasion of Alexander the Great, the inscriptions of Ashoka, the account of the Chinese travellers, and the overthrow of Buddhism and Jainism by Bhatta Kumarila and Shankaracharya, joined with several other less important

^{*} India: what it can teach us? p. 112. The references throughout are to the first edition of this work.

events, have served to fix the chronology of the later periods of the Ancient Indian History. But the earlier periods of the same still defy all attempts to ascertain their chronology; and the earliest of them all, so important to the "true student of mankind," the period of the Rigveda, is still the subject of vague and uncertain speculations. Can we or can we not ascertain the age of the Vedas? This is a question which has baffled the ingenuity of many an ancient and a modern scholar, and though I have ventured to write on the subject I cannot claim to have finally solved this important problem in all its bearings. I only wish to place before the public the result of my researches in this direction and leave it to scholars to decide if it throws any additional light on the earliest periods of the Aryan civilization.

But before I proceed to state my views, it may be useful to briefly examine the methods by which Oriental scholars have hitherto attempted to solve the question as to the age and character of the Vedas. Prof. Max Müller divides the Vedic literature into four periods—the Chhandas, Mantra, Brâhmaṇa, and Sûtra; and as each period presupposes the preceding, while the last or the Sûtra period is prior, "if not to the origin, at least to the spreading and political ascendancy of Buddhism" in the fourth century before Christ, that learned scholar, by assigning two hundred years for each period arrives at about 1200 B. C., as the latest date, at which we may suppose the Vedic hymns to have been composed. This, for convenience, may be

^{*} See Max Müller's 1st Ed. of Rig. Vol. IV., Pref. pp. v., vii. This preface is also printed as a separate pamphlet under the title "Ancient Hindu Astronomy and Chronology." In the second edition of the Rig veda the prefaces in the first edition are reprinted all together at the beginning of the fourth Volume.

called the literary or the linguistic method of ascertaining the age of the Vedas. A little consideration will, however, at once disclose the weak points in such arbitrary calculations. There are different opinions as to the division of the Vedic literature; some scholars holding that the Chhandas and Mantra is one period, though a long one. But granting that the Vedic literature admits of a four-fold division, the question of the duration of each period is still involved in uncertainty and, considering the fact that each period might run into and overlap the other to a certain extent, it becomes extremely difficult to assign even the minimum chronological limits to the different periods. The method may, indeed, be used with advantage to show that the Vedas could not have been composed later than a certain period; but it helps little in even approximately fixing the correct age of the Vedas. Prof. Max Müller himself admits that the limit of 200 years can be assigned to each period only under the supposition that during the early periods of history the growth of the human mind was more luxuriant than in later times; while the late Dr. Haug, following the same method, fixed the very commencement of the Vedic literature between 2400-2000 B. C., t by assigning about 500 years to each period, on the analogy of similar periods in the Chinese literature. It is therefore evident that this method of calculation, howsoever valuable

^{*} Pref. to Rig. Vol. IV., p. vii.

[†] Introduction to the Aitareya Brâhmana, p. 48. Prof. Whitney thinks that the hymns may have been sung as early as 2000 B. C. Vide Intro. to his Sanskrit Grammar, p. xiii. For a summary of the opinions of different scholars on this point see Kaegi's Rigveda translated by Arrowsmith, p. 110, note 39. The highest antiquity assigned is 2400 B. C.

it may be in checking the results arrived at by other methods, is, when taken by itself, most vague and uncertain. A further study of the different periods of the Vedic literature and its comparison with other ancient literatures. might hereafter help us to ascertain the duration of each period a little more accurately. But I think we cannot expect, by this method alone, to be ever in a position to fix with any approach to certainty the correct age of the Vedas. Prof. Max Müller considers 200 years to be the minimum duration of each period, while Dr. Haug and Prof. Wilson thought that a period of 500 years was not too long for the purpose; † and I believe there is hardly any inherent improbability if a third scholar proposes to extend the duration of each of these periods up to something like 1000 years. In the face of this uncertainty we must try to find out other means for ascertaining the correct age of the Vedas.

The Vedas, the Brahmanas and the Sûtras contain numerous allusions and references to astronomical facts, and it was believed that we might be able to ascertain from them the age of the oldest literary relic of the Aryan race. But somehow or other the attempts of scholars to fix the age of the Vedas by what may be called the astronomical method, have not yet met with the expected success. Unfortunately for us, all the Sanskrit astronomical words that we now

In a paper submitted to the Ninth Oriental Congress, Mr. Dhruvahas recently examined the whole Vedic literature with a view to ascertain its chronology, and he arrives at the conclusion that the duration assigned to the several periods of the Vedic literature by Prof. Max Müller is too short, and that "without making any guesses at numbers of years or centuries" we should at present be content with arranging the Vedic literature somewhat after the manner of the Geological strata or periods

[†] See Ait. Br. Intr., p. 48; also Pref. to Rig. Vol. IV., p. viii.

possess, except perhaps the Vedânga Jyotisha, belong to the later period of Sanskrit literature, when the Greek influence is perceptible in all its mathematical works. The different methods of astronomical calculations given in these works, the various eras that were established in India after Shali. vâhana or Vikrama, the introduction of the Bârhaspatya cycle, and the adoption of the Greek division of the Zodiac, make it extremely difficult to correctly interpret the astronomical references in the later works; while the confusion, caused by the supposed absence of any definite statement as to the character of the year and the cycle mentioned in the Vedic works, renders it a hard task to deduce a consistent theory out of the various but stray references to astronomical facts in the Vedic literature. Take for instance the question of the commencement of the year in the Vedic calendar. There are grounds to hold that the ancient Aryas commenced their year either with spring or with autumn, at the equinoxes or at the solstices; while the later astronomical works and systems furnish us with facts which go to prove that the year, in the different parts of India, commenced with almost all the different months of the year-Kârtika, Mârgashîrsha, † Âshâdha, Chaitra and Bhâdrapada. The discussion as to the number of the Nakshatras and different opinions as to their origin have further complicated the problem; while doubts have been raised as to the capacity of the Brâhmans in 1200 B.C. to make observations of solstitial points with astronomical accuracy.‡ I shall

^{*} See infra Chap. II.

[†] Whitney's Sûrya Siddhânta xiv., 16, n.

[‡] Pref. to Rig. Vol. IV., p. xxix. It is very difficult to understand on what grounds this assertion is made. Ancient Vedic bards had no mathematical instruments, but still they could have easily marked when day and night became equal in length.

have to examine hereafter how far some of these objections are tenable. For the present it is sufficient to state that in consequence of such doubts and objections, definite observations or allusions to astronomical events in the earliest works have been looked upon with suspicion by a good many Oriental scholars, while some have even condemned the astronomical method as inaccurate and conjectural.* It is, however, admitted that "if the astronomical date on which conclusions as to the age of the Veda have been built implied all that they were represented to imply, the earliest periods of Vedic poetry will have to be rearranged."†

It appears to me that scholars have erred too much on the side of overcautiousness in condemning this method. I do not mean to say that there are no difficulties; but sufficient care does not appear to have been taken to always keep in view the main point of the inquiry, by separating it from the mass of irrelevant matter, with which, in some cases it becomes unavoidably mixed up. Some of Bentley's speculations, for instance, are indeed ingenious and suggestive, but he relies too much upon Puranic traditions. mere etymological speculations and his own calculations based thereon, instead of trying to find out whether there is anything in the earlier works to corroborate or support these traditions. On the other hand, Prof. Weber's Essay, which, as a collection of astronomical allusions and references in the Vedic literature, is extremely valuable, is taken up by the controversy as to the origin of the Nakshatras raised by M. Biot; and the same thing may be said of Prof. Whitney's contributions on the subject. I Various

[·] See Weber's History of Indian Literature, p. 2, note.

[†] Pref. to Rig. Vol. IV., p. 1xxi.

[!] See his essay on the Hindu and Chinese systems of Asterisms.

other questions, such as whether the Vedic cycle comprised five or six years, how and when the intercalary days or months were inserted to make the lunar correspond with the solar year, have also caused the attention of scholars to be diverted from the broad astronomical facts and observations to be found recorded in the Vedic literature; and as a consequence we find that while the questions as to the original number of the Nakshatras and as to whether the Chinese borrowed them from the Hindus or vice versâ, are so ably discussed, no systematic attempt has yet been made to trace back the astronomical references in the later works to the Sanhitâs, and to fully examine their bearing on the question of the age and character of the Vedas. On the contrary, Prof. Weber asks us to reconcile ourselves to the fact that any such search will, as a general rule, be absolutely fruitless!* In the following pages I have endeavoured to shew that we need not be so much disappointed. In my opinion there is ample evidence—direct and circumstantial—in the earliest of the Sanhitâs, to fully establish the high antiquity assigned to the Indian literature on geographical and historical grounds,† I base my opinion mainly upon references to be found in the early Vedic works, the Sanhitâs and the Brâhmanas, and especially in the earliest of these, the Rigveda. For though later works may sometimes give the same traditions and references, yet any inference which is based upon them is likely to be regarded with more or less suspicion, unless we can show

^{*} Weber's History of Indian Literature, p. 7

f It is on these grounds that Prof. Weber believes that the beginnings of the Indian Literature "may perhaps be traced back even to the time when the Indo Aryans still dwelt together with the Persa-Aryans." Hist. Ind Lit., p. 5.

something in the earliest works themselves to justify that inference. Where the Sanhitas and the Brahmanas directly speak of the actual state of things in their time, there is, of course, no ground to disbelieve the same, but I think that even the traditions recorded in these works are more reliable than those in later works, for the simple reason that those traditions are there found in their purest form. Later works may indeed be used to supply confirmatory evidence. where such is available; but our conclusions must in the main be based on the internal evidence supplied by the Vedic works alone. Several Indian astronomers have worked more or less on the lines here indicated, but their labours in this direction have not unfortunately received the attention they deserve. The late Krishna Shâstri Godbole published his views on the antiquity of the Vedas in the second and third Volumes of the Theosophist, and though he has failed to correctly interpret some astronomical allusions in the Vedic works, yet there is much that is suggestive and valuable in his essay. The late Prof. K. L. Chhatre also appears to have held similar views on the subject, but he has not published them, so far as I know, in a systematic form. My friend Mr. Shankara Bâlkrishna Dikshit, who has written a prize essay in Marâthî on the history of Hindu Astronomy, and who has succeeded in correctly interpreting more verses in the Vedanga Jyotisha† than any other scholar has hitherto

^{*} Also published as a separate pamphlet.

[†] Mr. Dikshit would do wel! to publish an English translation of at least the Chapter on Vedânga Jyotisha in his essay. He has undoubtedly made a great advance over Weber and Thebaut in the correct interpretation of the treatise.

done, has also discussed this question in his essay, which I was allowed to read in MS. through his kindness. I am indebted to these scholars for some of the facts and arguments set forth in the following pages, and the present essay may, I think, be regarded as greatly developing, if not completing, the theory started by them.

CHAPTER II.

SACRIFICE alias THE YEAR.

Primitive calendar co-eval with the sacrificial system—Prajâpati = Yajna = Samvatsara—Civil or sâvana days—Sâvana and lunar months—Lunar and solar years—Intercalary days and months in Vedic times—Solar year was siderial and not tropical—Old begin ning of the year and the sacrifice.—The Vishuvân day—Vernal equinox and winter solstice—Uttarâyaṇa and Dakshiṇâyana—Devayâna and Pitriyâna—Their original meaning—Bhâskarâ chârya's mistake about the day of the Devas—The two year beginnings were subsequently utilised for different purposes.

It is necessary, in the first place, to see what contrivances were adopted by the ancient Aryas for the measurement and division of time. The present Indian system has been thus described by Professor Whitney in his notes to the Sûrya Siddhânta (1. 13, notes):—

"In the ordinary reckoning of time, these elements are variously combined. Throughout Southern India (see Warren's Kâla Sankalita, Madras, 1825, p. 4, etc.), the year and month made use of are the solar, and the day the civil; the beginning of each month and year being counted, in practice, from the sunrise nearest to the moment of their actual commencement. In all Northern India the year is luni-solar; the month is lunar and is divided into both lunar and civil days; the year is composed of a variable number of months, either twelve or thirteen, beginning always with the lunar month, of which the commencement next precedes the true commencement of the sidereal year. But underneath this division, the

"is likewise kept up, and to maintain the concurrence of the civil and lunar days, and the lunar and solar months, is a process of great complexity, into the details of which we need not enter here."

But the complications here referred to are evidently the growth of later times. The four ways of reckoning time, the Sâvana, the Chândra, the Nâkshatra and the Saura, are not all referred to in the early works, and even in later days all these measures of time do not appear to have been fully and systematically utilised. There is, as I have said before, no early work extant on Vedic calendar, except the small tract on Jyotisha, and our information about the oldest calendar must, therefore, be gathered either from stray references in the Vedic works or from the early traditions or practices recorded in the old sacrificial literature of India. There are several sacrificial hymns in the Rigveda, which show that the sacrificial ceremonies must then have been considerably developed; and as no sacrificial system could be developed without the knowledge of months, seasons, and the year, it will not be too much to presume that in Vedic times there must have existed a calendar to regulate the sacrifices. It is difficult to determine the exact nature of this calender, but a study of the sacrificial literature would show that the phases of the moon, the changes in the seasons, and the southern and northern courses of the sun were the principal land-marks in the measurement of time in these early days. What is still more interesting, however, is that the leading features in the early sacrifices are the same as those in the year. The late Dr. Haug, in his introduction to the Aitareya Brâhmana, has observed that "the satras, which lasted for one year, were nothing but an imitation of the sun's yearly course. They were divided

into two distinct parts, each consisting of six months of 30 days each. In the midst of both was the Viskûvân, i. e. the equator or the central day, cutting the whole satra into two halves." This clearly shows that the ancient Rishis prepared their calendar mainly for sacrificial purposes, and the performance of various sacrifices facilitated, in its turn, the keeping up of the calendar. Offerings were made every morning and evening, on every new and full moon, and at the commencement of every season and ayana. † When this course of sacrifices was thus completed, it was naturally found that the year also had run its course, and the sacrifice and the year, therefore, seem to have early become synonymous terms. There are many passages in the Brâhmanas and Sanhitâs, where Samvatsara and Yajna are declared to be convertible terms, I and no other theory has yet been suggested on which this may be accounted for. I am therefore inclined to believe that the Vedic Rishis kept up their calendar by performing the corresponding round of sacrifices on the sacred fire that constantly burnt in their houses, like the fire of the Parsi priest in modern times. The numerous sacrificial details, which we find so fully described in the Brâhmanas, might be later innovations,

^{*} Ait. Br. Intr., p. 48.

[†] Cf. Baudhâyana Sutras, ii. 4.23, which describes the continuous round of sacrifices as follows:—अग्न्याध्यप्रभृत्यधेमान्यज्ञस्ताणि भवंति यथैतदग्न्याधेयमिमहोत्रं दर्शपूर्णमासावाप्रयणमुदगयनदाक्षणायनयोः पञ्चआर्तुर्मास्यान्यृतुमुखे षड्ढोता वसंते ज्योतिष्टोम इत्येवं क्षेमप्रापणम्।
Also compare Manu iv. 25 26, and Yâjnavalkya i, 125,

[‡] See Ait, Br, ii. 17, which says संवत्सर: प्रजापति: | प्रजापतिर्थमः | Also Ait. Br. iv. 22; Shatapatha Br. xi. 1. 1. 1; 2. 7. 1. In Taitt. San. ii. 5. 7. 3; vii. 5. 7. 4 we have यज्ञो व प्रजापति:, and again in vii. 2. 10. 3 संवत्सर: प्रजापति: |

but the main idea of the yearly sacrifice appears to be an old one. The etymology of the word ritvij (ritu + yaj = season sacrificer) shows that even in the oldest days there existed a certain correspondence between the sacrifices and the seasons, and what is true of the seasons is true of the year which according to one derivation of samuatsara (vas = to dwell) is nothing but a period where seasons dwell, or a cycle of seasons.* The priests were not only the sacrificers of the community, but were also its time-keepers,† and these two functions they appear to have blended into one by assigning the commencement of the several sacrifices to the leading days of the year, on the natural ground that if the sacrifices were to be performed they must be performed on the principal days of the year. I Some scholars have suggested that the yearly satras might have been subsequently invented by the priests. But the hypothesis derives little support from the oldest records and traditions of all the sections of the Aryan race. Without a yearly satra

^{*} Cf, Bhânu Dikshita's Com. on Amar a i, 4, 20, Dr. Schrader, in his Prehistoric Antiquities of the Aryan Peoples, Part iv., Ch. vi. (p. 305) also makes a similar observation. He holds, on philological grounds, that the conception of the year was already formed in the primeval period by combining into one whole the conception of winter and summer, which he believes to be the two primeval seasons.

f "In Rome the care of the calendar was considered a religious function, and it had from carliest times been placed in the hands of the pontiffs." Lewis's Historical Survey of the Astronomy of the Ancients, p. 24.

that the sacrifices and festivals may correspond with the natural seasons; and Cicero remarks that the system of intercalation wa introduced with this object." Lewis's His. Astr. Anc., p. 19

regularly kept up a Vedic Rishi could hardly have been able to ascertain and measure the course of time in the way he did. When better contrivances were subsequently discovered the sacrifice might naturally become divested of their time-keeping function and the differentiation so caused might have ultimately led to an independent development of both the sacrifices and the calendar. It is to this stage that we must assign the introduction of the numerous details of the yearly sacrifice mentioned in later works; and thus understood, the idea of a sacrifice extending over the whole year, may be safely supposed to have originated in the oldest days of the history of the Aryan race.* In fact, it may be regarded as coeval with, if not antecedent to, the very beginning of the calendar itself.

We have now to examine the principal parts of the year, alias the sacrifice. The sâvana or the civil day appears to have been, as its etymology shows,† selected in such cases as the natural unit of time. 30 such days made a month and 12 such months or 360 sâvana days made a year.‡ Comparative Philology, however, shews that the names

^{*} Comparative Philology also points to the same conclusion; Cf. Sanskrit yaj, Zand yaj, Greek agos. It is well-known that the sacrificial system obtained amongst the Greeks, the Romans and the Iranians.

[†] Savana is derived from su to sacrifice, and means literally a sacrificial day,

Ait. Br. ii. 17; Taitt, San. ii, 5, 8, 3; Rig, i, 164. 48, Prof. Whitney (Sur. 8id. 13,n) observes. "The civil (sâvana) day is the natural day.....A month of 30 and a year of 360 days are supposed to have formed the basis of the earliest Hindu Chronology, an intercalary month being added once in five years."

for the month and the moon coincide, with occasional small differences of suffix,* in most of the Indo-European languages, and we may therefore conclude that in the primitive Aryan times the month was determined by the moon. Now a month of thirty civil or sâvana days cannot correspond with a lunar synodical month, and the Brahmavâdius had therefore to omit a day in some of the savana months to secure the concurrence of the civil and the lunar months.† The year of 360 sâvana days was thus practically reduced to a lunar year of 354 civil days or 360 tithis. But a further correction was necessary to adjust the lunar with the solar reckoning of time. The zodiac was not yet divided into twelve equal parts, and the solar month, as we now understand it, was unknown. The commencement of the cycle of seasons was, therefore, the only means to correct the calendar, and the ancient Aryas appeared to have early hit upon the device of the intercalary days or month for that purpose. There are many passages in the Taittirîya and Vâjasaneyi Sanhitâs and also one in the Rigvedal wherein the intercalary month is mentioned, and though opinions may differ as to when and how it was inserted, we may, for the purpose of our present inquiry, regard it as undisputed that in the old Vedic days means were devised and adopted to secure

the correspondence of the lunar with the solar year. The occurrence of the twelve hallowed nights amongst the Teutons points to the same conclusion. They were in fact the supplementary days (366-354 = 12) required to balance the lunar with the solar year,—a period when the Ribhus, or the genii of the seasons, slackened their course and enjoyed the hospitality of the sun after toiling for a whole year (Rig. i. 33. 7.), and when Prajapati, the God of sacrifices, after finishing the old year's sacrifice, prepared himself for the new year's work (Atharva Veda iv. 11. 11.). The sacrificial literature of India still preserves the memory of these days by ordaining that a person wishing to perform a yearly sacrifice should devote 12 days (dvâdashâha) before its commencement to the preparatory rites. These facts, in my opinion, conclusively establish that the primitive Aryans had solved the problem involved in balancing the solar with the lunar year. There may be some doubt as to whether the concurrence of the two years was at first secured by intercalating twelve days at the end of every lunar year, or whether the days were allowed to accumulate until an intercalary month could be inserted. The former appears to have been the older method, especially as it has been utilised and retained in the performance of yearsy sacrifices; but which soever may be the older method, one thing is certain, that primitive Aryas had contrived means for adjusting the lunar with the solar year. Prof. Weber and Dr. Schradert appear to doubt the conclusion on the sole ground that we

^{*} See Zimmer's Life in Ancient India, p. 366; Kaegi's Rigveda (translation by Arrowsmith), pp. 20, 37.

[†] See Indische Studien, xviii. 224, and Dr. Schrader's observations thereon in his Prehistoric Antiquities of Aryan Peoples, Part iv., Chap. vi., pp. 308—10.

cannot suppose the primitive Aryans to have so far advanced in civilization as to correctly comprehend such problems. This means that we must refuse to draw legitimate inferences from plain facts when such inferences conflict with our preconceived notions about the primitive Aryan civilization. I am not disposed to follow this method, nor do I think that people, who knew and worked in metals, made clothing of wool, constructed boats, built houses and chariots, performed sacrifices, and had made some advance in agriculture, were incapable of ascertaining the solar and the lunar year. They could not have determined it correct to a fraction of a second as modern astronomers have done; but a rough practical estimate was, certainly, not beyond their powers of comprenension. Dr. Schrader has himself observed that the conception of the year in the primeval period was formed by combining the conceptions of the seasons † If so, it would not be difficult, even for these primitive Aryans, to perc ive that the period of twelve full moons fell short of their seasonal year by twelve days. Dr. Schrader again forgets he fact that it is more convenient, and hence easier and more natural, to make the year begin with a particular season or a fixed position of the sun in the heavens, than to have an ever-varying measure of time like the lunar year. Lewis, in his Historical Survey of the Astronomy of the Ancients, quotes Geminus to shew that "the system pursued by the ancient Greeks was to determine their months by he moon and their years by the sun,"t and

^{*} For a short summary of the primitive Aryan civilization, see Peile's Primer of Philology, pp. 66, 67; also Kaegi's Rigveda, translated by Arrowsmith, pp. 11-20

[†] See reh. Ant. Ary Peoples translated by Jevons, p 305.

this appears to me to have been the system in force in the Indo-Germanic, or at any rate in the primitive Vedic period. There is no other conclusion that we can fairly draw from the facts and passages noted above.

There is, however, a further question, as to whether the solar year, with reference to which these corrections were made, was tropical or sidereal. It is true that the great object of the calender was to ascertain the proper time of the seasons. But the change in the seasons consequent upon the precession of the equinoxes is so exceedingly minute as to become appreciable only after hundreds of years, and it is more probable than not that it must have escaped the notice of the early observers of the heavens, whose only method of determining the position of the sun in the ecliptic was to observe every morning the fixed stars nearest that luminary. Under such a system the year would naturally be said to be complete when the sun returned to the same fixed star. Prof. Whitney has pointed out that the same system is followed in the Surya Siddhanta, though the motion of the equinoxes was then discovered.† It is, therefore, natural to presume that the early Vedic priests were ignorant of the motion of the equinoxes. No early work makes any mention of or refers to it either expressly or otherwise; and the solar year mentioned in

[•] Taitt. Br. i. 5. 2. 1; यत्पुण्यं नक्षत्रं तद्वदकुर्वीतोपन्युषम् । यदा वे सूर्य उदेति । अथ नक्षत्रं नेति । यावति तत्र सूर्यो गच्छेत् । यत्र जवन्यं पद्येत् । तावस्कुर्वीत यत्कारी स्यात् । पुण्याइ एव कुरुते । This is still recited at the Pupyaha-vachana ceremony.

[†] Sur Sid. i. 13. n. "It is, however, not the tropical solar year which we employ, but the sidereal, no account being made of the precession of the equinoxes."

the Vedic works must, therefore, be considered as sidereal and not tropical. This would necessitate a change in the beginning of the year, every two thousand years or so, to make it correspond with the cycle of natural seasons, and the fact that such changes were introduced twice or thrice is a further proof of the old year being a sidereal one. The difference between the sidereal and the tropical year is 20'4 minutes, which causes the seasons to fall back nearly one lunar month in about every two thousand years, if the sidereal solar year be taken as the standard of measurement. When these changes and corrections came to be noticed for the first time, they must have created a great surprise, and it was not till after one or two adjustments on this account were made that their true reason, the motion of the equinoxes, could have been discovered. Garga tells us that if the sun were to turn to the north without reaching Dhanishthâ,† it foretold great calamity, and I am disposed to put a similar interpretation upon the story of Prajapati alias Yajna alias the year, who, contrary to all expectations, moved backwards to his daughter Rohini. But as I wish to examine the tradition more fully hereafter, it is not necessary to dilate on the point here. My object at present is to show that the Vedic solar year was sidereal and not tropical, and what has been said above is, I believe

यदा निवर्ततेऽप्राप्तः श्रविष्ठामुत्तरायणे ।

आश्चेषां दक्षिणेऽपासस्तदा विद्यान्महाभयम् ॥

^{*} The Krittikâs once headed the list of the Nakshatras, which now begins with Ashvinî. Other changes are discussed in the following chapters of this work.

[†] Garga quoted by Bhattotpala on Brihat. San. iii. 1:-

Ait. Br. iii. 33. The passage is discussed in this light further on in Chapter VIII. See also Shat. Br. i. 7. 4. 1.

sufficient to justify such a presumption, at least for the present, though it may afterwards be either retained or discarded, according as it tallies or jars with other facts.

Opinions differ as to whether the lunar month began with the full or the new moon, and whether the original number of Nakshatras was 27 or 28. † But I pass over these and similar other points as not very relevant to my purpose, and take up next the question of the commencement of the year. I have already stated that the sacrifice and the year were treated as synonymous in old days, and we may, therefore, naturally expect to find that the beginning of the one was also the beginning of the other. The Vedânga Jyotisha makes the year commence with the winter solstice, and there are passages, in the Shrauta Sùtras which lay down that the annual sacrifices like gavûm-ayana, should be begun at the same time. I A tradition has also been recorded by Jaimini and others that all Deva ceremonies should be performeds only during the Uttarayana; and the Uttarâya ja, according to the several Jyotisha works, is the period of the year from the winter to the summer solstice,

[•] See Kala Madhava, Chapter on Month, Cal. Ed., p. 63; पे.णंमास्यं. तस्व श्रते: कटाक्षा भ्यान्। We can thus explain why the full moon night of a month was described as the first night of the year. See infrat Pref. to Rig., Vol. IV., and Whitney's Essay on the Hindu and

that is, from the time when the sun turns towards the north till it returns towards the south. This leads one to suppose that the winter solstice was the beginning of the year and also of the Uttarayana at the time when the annual sacrifices were established, and therefore in the old Vedic days. But a closer consideration of the ceremonies performed in the yearly satras will show that the winter solstice could not have been the original beginning of these satras. The middle day of the annual satra is called the Vishuvan day, and it is expressly stated that this central day divides the satra into two equal halves, in the same way as the Vishûvân or the equinoctial day divides the year. The satra was thus the imitation of the year in every respect, and originally it must have corresponded exactly with the course of the year. Now, as Vishûvân literally means the time when day and night are of equal length, if we suppose the year to have at the time commenced with the winter solstice, the Vishuvan or the equinoctial day could never have been its central day, and the middle day of the satra would correspond, not with the equinoctial, as it should, but with the summer solstice. It might be urged that Vishûvûn as referring to the salra should be supposed to be used in a secondary sense. But this does not solve the difficulty. It presupposes that Vishuvan must have been used at one time in the primary sense (i. e., denoting the time when day and night are equal), and if in its primary sense it was not used with reference to the satra, it must have been so used at least with reference to the year. But if Vishuvûn was thus the central day of the year, the year must have once commenced with the equinoxes. The word

^{*} Ait. Br. iv. 22; Taitt. Br. i. 2. 3. 1; Tân. Br. iv. 7. 4.

uttaráyana is again susceptible of two interpretations. It may mean "turning towards the north from the southernmost point," or it may indicate "the passage of the sun into the northern hemisphere, i.e., to the north of the equator." If we adopt the first meaning, the Uttarayana and the year must be held to commence from the winter solstice, while if the second interpretation be correct, the Uttarayana and the year must have once commenced with the vernal equinox. The facts, that the central day of the annual satra was called vishuvan, that Vasanta or spring was considered to be the first of the seasons.* and that the agravaneshtis or the half-yearly sacrifices were required to be performed every Vasanta (spring) and Sharad (autumn) t clearly shew that the second of the two interpretations given above is more likely to be the older one. Let us, however, examine the point more fully.

The only passages where uttarayana is mentioned in the Vedic works are those wherein the white and the black paths for the souls of the deceased, the Devayana and the Pitriyana, are described. The words devayana and pitriyana occur several times in the Rigveda. Agni is said to know both these; while in the Vajasaneyi Sannita 19. 47, these are said to be the two paths open to mortals. In the Rigveda x. 18, 1, the path of the god of Death is said to be the reverse of devayana, and in the Rigveda x. 98. 11, Agni is said to know devayana by seasons. There is, however,

^{*} Taitt. Br. i. 1. 2. 6. मुसं वा एतदत्नां यद्वसंतः । Upon this the author of Kâla Mâdhava observes संवत्सरोपकमरूपत्वेन वसंतर्ध प्राथर्थ द्रष्टस्यम् । Cal. Ed., p. 59.

धिद्वान्पय ऋतुशो देवयानान्। Sayana, however, takes ऋतुशः with the very धेहि. But query?

no passage in the Rigveda where devayûna is fully defined and we have consequently to refer to the passages in the Brihadaranyaka and the Chhandogya Upanishad for a fuller explanation of these terms. Before the idea was recorded in these works it must undoubtedly have received considerable additions, but nevertheless the original sense cannot be supposed to have been completely lost in these later additions. It is therefore extremely important to see how these two paths are described in the Brahmanas and Upanishads. Brih. vi., 2, 15 and Chh. iv. 15.5 state that "flame, day, the increasing moon, the six months when the sun is towards the north, the devaloka (Chh. devapatha) or the abode (Chh. patha) of gods, &c.," t is the way never to return; while "smoke, night, the decreasing moon, and the six months when the sun is towards the south, the pitriloka or the abode of Pitris" is the reverse. In the Bhagavad Gitâ viii. 24, 25 we find the same sentiments in modern phraseology, and the question is, what is meant by the phrase "the six months when the sun is towards the north." or, as Yaska and the Gita have it, "the six months I of the

^{*} See also Yaskas Nirukta 14. 9; Mahanarayanopanishad 25, I; and Shankaracharya's Bhashya on Brahma Sutras iv. 2. 18—21, where all such passages are collected and discussed

[|] अधिवेदरन्ह आपूर्यमाणपक्षमापूर्यमाणपक्षाद्यान्यणमासानुदङ्ङादित्य पृति मासेम्यो देवलोकं...तेषां न पुनरावृत्तिः । धूमाद्गातं रात्ररपक्षीयमाणपक्ष-मपक्षीयमाणपक्षाद्यान्यणमासान् दक्षिणादित्य एति मासेम्यः पितृलोकम्...। Brihadar, vi. 2. 15. Inclead of "six months when sun goes north and south," Yaska and Mahana use the words सद्गयन and दक्षिणायन while in Chh. we; have देवपथ instead of देवलोक in Brihad. In hausi, 3, it is called देवयान.

[‡] अभिज्योतिरहः शुक्कः षण्मासा ष्ठत्तरायणम् । Gità viii. 24.

Uttarayana." Almost all the commentators have interpreted the expression to mean the six months from the winter to the summer solstice. But notwithstanding their high authority it will be found that their interpretation, though in consonance with the later astronomical views, is directly opposed to the passages in the Vedic works. In the Taittiriya Sanhitâ vi. 5. 3, we are told "the sun, therefore, goes by the south for six months and six by the north" But this does not help us in ascertaining the correct meaning of the phrase "by the north." As it stands it may mean either the solstitial or the equinoctial six months. We must therefore look for another passage, and this we find in the Shatapatha Brâhmana (ii. 1. 3, 1-3), where in describing the two aforesaid paths it lays down in distinct terms that Vasanta, Grishma and Varsha are the seasons of the Devas; Sharad, Hemanta and Shishira those of the Pitris; the increasing fortnight is of the Devas; the decreasing one of the Pitris: the day is of the Devas; the night of the Pitris: again the first part of the day is of the Deva; the latter of the Pitris...... When he (the sun) turns to the north, he is amongst the Devas and protects them; when he turns to the south he is amongst the Pitris and protects them."t

^{*}Shankaracharya is not explicit; yet his reference to the death of Bhishma shows that he takes the same view. Anandgiri on Prashnopanishad i. 9, says उथेष्ठादिदेशिणायनम् ।

As the passage is important I give it here in fuli:-

वसंतो प्रीष्मो वर्षा। ते देवा ऋतवः शरदेमंतः शिशिरस्ते रितरो ब प्वाप्यतेऽर्धमासः स देवा योऽपर्कायते स पितरोऽहरेव देवा रात्रिः पितरः पुनरन्हः पूर्वाण्हो देवा अपराण्हः पितरः।....। स यत्र उदगावर्तते देवेषु सर्हि भवति देवांस्तद्यांमिगोपायस्यथ यत्र दक्षिणावर्तते पितृषु तार्हे भवति पितृंस्तद्यीभेगोपायति।

This removes all doubts as to what we are to understand by devayana, devapatha, or devaluka and uttarayana as connected with it. The Brihadaranyaka Upanishad is a part of the Shatapatha Brâhmana, and we shall not be violating any rule of interpretation if we interpret the passage in the one in the light of a similar passage in the other. Now if Vasanta (spring), Grîshma (summer) and Varshâ (rains) were the seasons of the Devas and the sun moved amongst the Devas when he turned to the north, it is impossible to maintain that the Devayana or the Uttarayana ever commenced with the winter solstice, for in neither hemisphere the winter solstice marks the beginning of spring, the first of the Deva seasons. The seasons in Central Asia and India differ. Thus the rains in India commence about or after the summer solstice, while in the plains of Asia the season occurs about the autumnal equinox. But in neither case Vasanta (spring) commences with the winter solstice or Varsha (rains) ends at the summer solstice. We must therefore hold that Devayana in those days was understood to extend over the six months of the year, which comprised the three seasons of spring, summer, and rains, i.e., from the vernal to the autumnal equinox, when the sun was in the northern hemisphere or to the north of the equator. This shows further that the oldest order of seasons did not place Varshå (rains) at the summer solstice, when the chief Indian monsoon commences; but at the autumnal equinox. The winter solstice, according to this order, falls in the middle of Hemanta. In the modern astronomical works, the winter solstice is, however, placed at the end and not in the middle of Hemanta, while the vernal equinox is said to fall in the middle of Vasanta. When the Vedic Aryas became

settled in India, such a change in the old order of seasons was necessary to make them correspond with the real aspect of nature. But it is difficult to determine exactly when this change was made. The old order of seasons given in the passage above quoted, however, clearly states that Vasanta in old days commenced with the vernal equinox. We can now understand why Vasanta has been spoken of as the first season and why the Nakshatras have been divided into two groups called the Deva Nakshatras and the Yama Nakshatras.† I am aware of the theory which attempts to explain away the passages above cited as metaphorical to avoid the appearance of superstition.I But the method is neither sound nor necessary. The path of the Devas and the path of the Pitris are several times referred to in the Rigveda, and though we might suppose the Brahmavadins to have developed the two ideas to their utmost extent, it cannot be denied that the original idea is an old one, suggested by the passage of the sun in the northern and southern hemispheres.

In the absence of anything to the contrary we might therefore take it as established that in the early Vedic days the year began when the sun was in the vernal equinox; and as the sun then passed from the south to the north of the equator it was also the commencement of his northern passage. In other words, the Uttarâyaṇa (if such a word was then used), Vasanta, the year and the Satras all commenced together at the vernal equinox. The autumnal equinox which came after the rains was the central day of

See Zimmer's Life in Ancient India p. 371. Kaegi's Rigveda, p. 116, note 68.

[†] Taitt. Br. i. 1. 2. 6 and i. 5. 2. 6. † See Thomson's Bhagavad Gîta, p. 60.

the year; and the latter half of the year was named the Pitriyâna or what we would now call the Dakshinâyana. It is difficult to definitely ascertain the time when the commencement of the year was changed from the vernal equinox to the winter solstice. But the change must have been introduced long before the vernal equinox was in the Krittikâs, and when this change was made uttarâyana must have gradually come to denote the first half of the new year, i.e., the period from the winter to the summer solstice, especially as the word itself was capable of being understood in the sense of "turning towards the north from the southernmost point," I am of opinion, however, that devayana and pitriyana, or devaloka and pitriloka were the only terms used in the oldest times. It is a natural inference from the fact that the word uttarayana, as such, does not occur in the Rigveda. The fact, that Vishûvân was the central day of the yearly satra, further shows that the sacrificial system was coeval with the division of the year into the paths of Devas and Pitris. After a certain period the beginning of the year was changed to the winter solstice, and it was sometime after this change was made that the words uttaráyana and dakshinâyana came to be used to denote the solstitial divisions of the year. But devayana and pitriyana could not be at once divested of the ideas which had already become associated with them. Thus while new feasts and sacrifices came to be regulated according to uttaráyana and dakshinayana, devayana and pitriyana with all the associated ideas continued to exist by the side of the new system, until they became either gradually assimilated with the new system or the priests reconciled the new and the old systems by allowing option

to individuals to follow whichever they deemed best. We must therefore take great care not to allow the idea of ultaiâyana, as we now understand it, to obscure our vision in interpreting the early Vedic traditions, and that too much care can never be taken is evident from the fact that even so acute an astronomer as Bhaskaracharya was at a loss to correctly understand the tradition that the Uttarâyana was the day of the Devas. In his Siddhanta Shiromani he raises the question how the Uttarayana, as it was generally understood in his day, could be the day of the Devas. He admits that the celestial beings on Meru at the North Pole behold the sun (during all the six months) when he is in the northern hemisphere (vii. 9) and these six months may therefore be properly called their day. But the word uttarâyana was then used to denote the period of six months from the winter to the summer solstice; and Bhaskaracharya was unable to understand how such an Uttarâyana could be called the day of the Devas by the writers of the astronomical Sanhitas. If the sun is visible to the Gods at Meru from the vernal equinox to the summer solstice, its passage back to the autumnal equinox lies through the same latitudes and in that passage, i. e., during three months after the summer solstice, the sun must, says Bhaskaracharya, be visible to the Gods. But according to the Sanhita-writers the day of the Devas ended with the Uttarayana, that is, as Bhaskara understood

^{*}In the Surya Siddbanta xii, 67 it is said that "At Meru Gods behold the sun, after but a single rising, during the half of his revolution beginning with Aries;" while in xiv. 9, the Uttarâyaṇa is said to commence "from the sun's entrance into Capricorn." The author, however, has not noticed the tradition that the Uttarâyana is the day of the Devas and the apparent inconsistency arising therefrom. Perhaps he understood the tradition in its true sense.

the word, at the summer solstice. How is this conflict to be reconciled? Bhaskaracharya could give no satisfactory solution of the difficulty, and asks his readers to reconcile the conflicting statements on the supposition that the doctrine may be regarded as referring to "judicial astrology and the fruits it foretells." Had Bhâskarâcharya however known that the word uttarilyana was sometimes used for devayana to denote the passage of the sun from the vernal to the autumnal equinox, I am sure, he would not have asked us to be satisfied with the lame explanation that the doctrine of the Sanhitâ-writers need not be mathematically correct as it refers exclusively to judicial astrology. It is difficult to say whether the ancient Arya- ever lived so near the north pole as to be aware of the existence of a day extending over at least two or three if not six months of the year. But the idea that the day of the Devas commences when the sun passes to the north of the equator appears to be an old one. In the Taittiriya Brahmanat iii. 9. 22. 1.

दिनं सुराणामयनं यदुत्तरं निशेतरत्सांहिर्तिकैः प्रकातिनम् । दिनोन्मुखेऽके दिनमेव तन्मतं निशा तथा तःफलकार्तनाय तत् । इन्द्रांतमारोहिति यैः क्रमेण तैरेव वृत्तरवरोहतीनः ।

यंत्रव दष्ट: प्रथमं स देवैस्तत्रैव तिष्टन् न विलोक्यते किम् ॥ Goladhyaya vii. 11-12, Bapudevashastri's Ed. pp 304, 5,

hazardous to case any theory upon this. Traditions like these have been cited as indicating the fact the North Pole was inhabited in old days! Similar other traditions are said to i dicate the existence of a pre glacial period. Is it not more probable to suppose that when uttarâyana and dakshinâyana came to be first dis inquished, they were respectively named 'day' and 'night' with a qualitying word to mark their special nature? The history of languages shews that when people come across new ideas they try to name them in old works. The Uttarâyana and the Dakshinâyana may have been thus conceived as God's day and night. See infra. Chap. V.

^{*}The original verses are as follows:

we are told that the year is but a day of the Devas and even Herodotus (4cc B. C.) mentions a people who sleep during the six months of the year. If the tradition is, therefore, as old as it is represented to be, it is impossible to reconcile it with the later meaning of uttardyana as commecing from the winter solstice and this would then furnish an additional ground to hold that in early times the Uttarâyana began with the vernal equinox as stated in the Shatapatha Brâhmana.

I have stated above that when the commencement of the year was altered from the vernal equinox to the winter solstice, uttarayana either lost its older meaning or was rather used to denote the solstitial division of the year. But this is not the only consequence of that change. With the year the beginning of the annual satras was also gradually transferred to the winter solstice and the change was complete when the Taittiriya Sanhita was compiled. In fact had it not been for the passage in the Shatapatha Brahmana it would have been impossible to produce any direct evidence of the older practice. When the beginning of the satra was thus changed, the Vishūvan day must have gradually lost its primary meaning and come to denote simply the central day of the yearly satra.

The old practice was not however completely forgotten and for the purpose of the Nakshatra-sacrifices the vernal equinox was still taken as the starting point. Thus it is that Garga tells us that "of all the Nakshatras the Krittikas are said to be the first for sacrificial purposes and Shravishtha for (civil) enumeration."† But even this distinction

^{&#}x27;Quoted in Narrien's Origin and Progress of Astronomy, p. 31.
†Quoted by Somakara on Ved. Jy. 5. तेषां च सर्वेगां नक्षत्राणां कर्मसु

appears to have been eventually lost sight of by the later writers and all references to uttarâyana were under stood to be made solely to the six months from the winter to the summer solstice, an error from which even Bhaska ràchârya did not escape, though he perceived the absurdity caused by it in some cases. At the present day we on the southern side of the Narmadâ begin the year at the verna equinox for all civil purposes, but still all the religiou. ceremonies prescribed to be performed in the Uttarâyana are performed during the Uttarayana beginning with the winter solstice, a position quite the reverse of that described by Garga. When we at the present day have been thus using the system of a double year-beginning, we need not be surprised if the ancient Aryas, after shifting the commencement of the year to the winter solstice, manager to keep up the old and the new system together by assigning the different beginnings of the year to different purposes a indicated by Garga. It was the only alternative possible i nothing old was to be entirely given up.

CHAPIER III.

THE KRITTIKÂS.

Nakshatras in old Vedic times generally mean asterisms and not zodiacal portions—The present and the older position of the solstices—In later works—In Vedânga Jyotisha—An objection against its antiquity examined—Passages in the Taittirîya Sanhitâ and Brâhamaṇa—The Krittikâs head the Nakshatras—Deva and Yama Nakshatras—Their real meaning—Taittirîya Sanhitâ vii. 4, 8, discussed—Jaimini's and Shabara's interpretation of the same—Conclusions deducible therefrom—Winter solstice in Mâgha—Vernal equinox in the Krittikâs—The age of the Sanhitâ—2350 B. C.—Bentley's arguments and views criticised.

WE HAVE seen that the ancient Aryas originally commenced their year, which was luni-solar and siderial, with the vernal equinox, and that when the beginning was changed to the winter solstice both the reckonings were kept up, the one for sacrificial and the other for civil purposes. Let us now examine if there is any reliable evidence to show that the Vedic priests made any corrections in the calendar when by the precession of the equinoxes the cycle of seasons gradually fell back. Ail our present calendars are prepared on the supposition that the vernal equinox still coincides with the end of Revati and our enumeration of the Nakshatras begins with Ashvini, though the equinox has now receded about 18° from Revatî. It has been shown by Prof. Whitney (Surya Siddhanta, viii., 9 note, p. 211) that the above position of the vernal equinox may be assumed to be true at about 490 A. D Taking this as the probable date of the introduction of the present system, we have now to see if we can trace back the position of the vernal equinox amorgst the fixed circle of stars. The question, so far, as

one antecedent stage is concerned, has been thoroughly discussed by Colebrooke, Bentley, Max Müller, Weber, Whitney, Biot, and other scholars: and I shall therefore only summarise what they have said, noting the points where I differ from them. I do not propose to enter into any detailed mathematical calculations at this stage of the inquiry, for I am of opinion that until we have thoroughly examined and discussed all the passages in the Vedic works bearing on this question, and settled and arranged our facts, it is useless to go into minute numerical calculations. The Vedic observations could not again be such as need any minute or detailed arithmetical operations. I shall therefore adopt for the present the simplest possible method of calculation, -a method which may be easily understood and followed by any one, who can watch and observe the stars after the manner of the ancient priests. We shall assume that the zodiac was divided into 27 parts, not by compass but by means of the leading stars, which Prof. Max Müller rightly calls the milestones of the heavens. The Vedic priest, who ascertained the motion of the sun by observing with his unaided eye the nearest visible star, cannot be supposed to have followed a different method in making other celestial observations; and, if so, we cannot assume that he was capable of recognizing and using for the purposes of observation any artificial divisions of the ecliptic on a mathematical principle, such as those which would result from the division of 360° of the zodiac into 27 equal parts, each part thus extending over 13° 20' of the ecliptic. Of course, such an artificial method might be easily followed in

^{*}Taitt. Br. i. 5. 2. 1, previously quoted. The passage is very important as it describes the method of making celestial observations in old times.

later days, when the means of observation increased and the science of arithmetic was developed. But in the earliest days of civilization, it is more natural to suppose that the motions of the sun and the moon were determined by observing which of the known fixed stars was nearest to them. When we. therefore, find it stated in the Vedic works that the sun was in the Krittikas, it is more probable that the fixed asterism. and not the beginning of the artificial portion of the zodiac. was intended. I admit that the accuracy of such observations cannot be relied upon within two or three degrees, if not more. But we must take the facts as they are, especially when it is impossible to get anything more accurate from the ancient observers of the heavens.* It will, I trust, however, be found that this inevitable want of accuracy in the old observations does not affect our conclusions to such an extent as to make them practically useless for chronological purposes. For instance, suppose that there is a mistake of 5° in observing the position of the sun with reference to a fixed star when the day and the night are of equal length. This would cause an error of not more than $5 \times 72 = 360$ years in our calculations; and in the absence of better means there is no reason to be dissatisfied even with such a result, especially when we are dealing with the remotest periods of antiquity. I shall, therefore, assume that references to the Nakshatras in the old Vedic works, especially in cases where the motions of other bodies are referred to them, are to the fixed

^{*}Similar observations have been recorded by Greek poets. Homer mentions 'the turns of the sun,' and Hesiod 'the rising and the setting of the Pleiades at the beginnings of day and night.' The observations in the Vedic works may be supposed to have been made in a similar way.

asterisms and not to the zodiacal portions. I may also state here that as a change in the position of the vernal equinox necessarily causes a similar change in the position of the winter solstice, both the beginnings of the year, previously referred to, would require to be simultaneously altered. Whenever, therefore, we find a change in the position of the vernal equinox recorded in the early works, we must look for the evidence of a corresponding alteration in the position of the winter solstice, and the corroborative evidence so supplied will naturally add to the strength of our conclusions. This will, I hope, sufficiently explain the procedure I mean to follow in the investigation of the problem before us. I shall now proceed to examine the passages which place the vernal equinox in the Krittikas, beginning with the latest writer on the subject.

It is now well-known that Varàhamihira, in whose time the vernal equinox coincided with the end of Revati and the summer solstice was in Punarvasù, distinctly refers in two places to the older position of the solstices recorded by writers who preceded him. "When the return of the sun took place from the middle of Âshleṣhâ," says he in his Pancha Siddhāntikâ, "the tropic was then right. It now takes place from Punarvasû." And, again, in the Brihat Sanhità iii., I and 2, he mentions the same older position of both the solstitial points and appeals to his readers to ascertain for themselves by actual observation which of the two positions of the solstices is the correct one, whether the older position of the

आश्चिषार्थादासीयदा निवृत्तिः किलोब्णिकरणस्य । युक्तमयनं तदासीत्सांप्रतमयनं पुनर्वसुतः॥

^{*}See Colebrooke's Essays, Vol. II., p. 387. The verse may now be found in Dr. Thibaut's edition of the work. It is as follows:—

solstices or that given by the writer. It is clear, therefore, that in the days of Varāhamihira, there existed works which placed the winter solstice in the beginning of (divisional) Dhanishthâ and the summer solstice in the middle of Ashleshâ. This statement of Varahamihira is fully corroborated by quotations from Gargat and Parashara which we meet with in the works of the later commentators; and it appears that the system of commencing the year with the month of Magha which corresponds with the above position of the solstices, was once actually in vogue. Amarasinha states that the seasons comprise two months each, beginning with Magha, and three such seasons make an ayana. The same arrangement of seasons is also mentioned in the medical works of Shushruta and Vagbhata, The account of the death of Bhishma, related in the Mahabharata Anushashana-parva 167, further shows that the old warrior, who possessed the superhuman power of choosing his time of death, was waiting on his deathbed for the return oi the sun towards the north from the winter

† Garga, quoted by Somâkara on Ved. Jy. 5, says:यदा माघस्य शुक्कस्य प्रतिपद्यत्तरायणम् ।
सहोदयं श्रविष्ठाभिः सोमाकें प्रतिपद्यतः ॥

Bhattotpala on Bribat. San. iii. 1, quotes Garga as follows:—

ļ Amara i. 4. 13 द्वी द्वी माघादिमासी स्यादृतुस्तैरयनं त्रिभि:।

^{*}Thus :-

[§] See Shushruta i. 6, and Vagbhata's Ashtangahridaya Sutrasthana iii. 2; both of which are quoted further on in Chap. IV.

solstice and that this auspicious event took place in the first half of the month of Magha.* It is evident from this that the winter solstice must have coincided in those days with the beginning of Dhanishtha as described in the Vedanga Jyotisha and other works.

There is thus sufficient independent evidence to show that before the Hindus began to make their measurements from the vernal equinox in Revati there existed a system in which the year commenced with the winter solstice in the month of Mâgha and the vernal equinox was in the last quarter of Bharani or the beginning of the Krittikâs.† We need not, therefore, have any doubts about the authenticity of a work which describes this older system and gives rules of preparing a calendar accordingly. Now this is what the Vedânga Jyotisha has done. It is a small treatise on the Vedic calendar, and though some of its verses still remain unintelligible, yet we now know enough of the work to ascertain the nature of the calculations given therein. It was once supposed that the treatise mentions the Râshis.

परिवृत्तो हि भगवान्सहस्रांशुर्दिवाकरः ॥२६॥

माधोऽयं समनुप्राप्तः मासः सौम्यो युधिष्ठिर। त्रिभागशेषः पक्षोऽयं गुक्को भवितुमहित ॥२८॥

Lele, Modak, Ketkar and other Hindu astronomers have recently tried to determine the date of the Mahâbhârata war from such references, and they hold that the vernal equinox was then in the Krittikas.

† Prof. Max Muller has pointed out that in the Atharva Veda i. 19. 7 and in the Yajnavalkya Smriti i. 267, the Krittikas occupy their early position, while the Vishnu Purana actually places the vernal equinox in the Krittikas. See Pref. to Rig., Vol. IV., p. xxxi.

^{*} Mah. Anu. 167, 26 and 28 :-

but a further study of the work has shown that though the word Râshi occurs in some of its verses, it is there used in a totally different sense. This work gives the following positions of the solstices and the equinoxes:—•

- 1. The winter solstice in the beginning of Shravishthâ, (divisional);
- 2. The vernal equinox in 10° of Bharani;
- 3. The summer solstice in the middle of Ashlesha, and—
- 4. The autumnal equinox in 3 20' of Vishâkhâ.

The first year of the cycle commenced with the winter solstice when the sun and the moon were together at the beginning of Dhanishtha and the Uttarayana also began at the same time. There is very little else in the Vedanga Jyotisha that may help us in our present inquiry except the fact that the enumeration of the deities presiding over the various Nakshatras begins with Agni, the presiding deity of the Krittikast. From these data astronomers have calculated that the solstitial colure occupied the position above mentioned between 1269 B. C. to 1181 B. C., according as we take the mean rate of the precession of the equinoxes 50" or 48" 6 a year. I

Some scholars, however, have boldly raised the question, what authority is there to hold that the position of the solstitial colure was recorded in the Vedanga Jyotisha from

अपर्यते अविष्ठादौ सूर्याचंद्रमसावुदक् । सार्पार्थे दक्षिणार्कस्तु माघश्रावणयोः सदा ॥

^{*} See Ved. Jy. Verse 5.—

[†] Cf. Ved. Jy. Verse 25. आप्तिः प्रजापतिः सोमो &c.,

[;] See the late Krishnashastri Godbole's Bssay on .he Antiquity of the Vedas., p. 18; also Pref. to Rig., Vol. IV., p. xxviii.

actual observation? It is conceded that the position of the solstitial colure might have been incorporated in the Jyotisha from real traditional information, but it is at the same itme contended that the language of the treatise and the methods given therein create doubts about the antiquity claimed for the work on the strength of the position of the solstitial points given therein. "I feel bound to remark," says Prof. Max Müller, "that unless there was internal evidence that the Vedic hymns reached back to that remote antiquity this passage in the Jyotisha would by itself carry no weight whatever." The existence of the different versions of the Vedanga Jyotisha and the obscurity into which some of its verses are still shrouded render it rather difficult to meet the above objection, especially as it is a side attack on the antiquity of the work with an admission that the position of the colure might have been recorded in the work from real traditions current in the time of its author. It is, however, needless to answer this objection, inasmuch as there is ample confirmatory evidence in the Vedic works themselves which not only bears out the statement in the Vedânga Jyotisha, but takes us back into still remoter antiquity.

There are many passages in the Taittiriya Sanhitâ, the Taittiriya Brâhmana and other works where the Krittikâs occupy the first place in the list of the Nakshatras.† In the Taittiriya Brâhmana (i. 1, 2, 1) it is distinctly stated

^{*} See Pref. to Rig., Vol. IV., p. xxv. The mention of a for ways, first in the list of symbolic representations of the Nakshatras in verse 14, lends some support to these doubts.

[†] These together with the list, wiil be found in Pref. to Rig., Vol IV., p. xxxiv. Cf. Taitt. San. iv., 4. 10; Taitt Br. iii, 1, 1. 6 and i. 5, 1. 2.

"one should consecrate the (sacred) fire in the Krittikâs;the Krittikas are the mouth of the Nakshatras."* This shows that the first place given to the Krittikas in the list of the Nakshatras is not accidental and that we must at least suppose that the Krittikas were the "mouth of the Nakshatras," in the same way as Vasanta or spring was the "mouth of the seasons" t or the Phâlguni full moon the "mouth of the year." The phrase is the same in all places and naturally enough it must be similarly interpreted. But granting that the Krittikas were the mouth of the Nakshatras in the sense that their list always commenced with them, it may be asked what position we are to assign to the Krittikas in the course of the year. There were, as I have previously shown, two beginnings of the year, the winter solstice and the vernal equinox; which of these two corresponded with the Krittikas? Or, are they to be supposed to have coincided with a point altogether different from these two? A little consideration will show that it is not difficult to answer these questions satisfactorily. present distance between the Krittikas and the summer solstice is more then 30°, and if they ever coincided with the summer solstice it must have been long ago in the present cycle of the precession of the equinoxes. We cannot therefore interpret the above passage so as to place the summer solstice in the Krittikas, unless we are prepared to take back the composition of the Taittiriya Sanhità to about 22,000 B. C., and further suppose that all evidence of the intermediate astronomical observations is entirely lost, and

[💆] कृतिकास्विप्रमादधीत ।। मुसं वा एतबक्षत्राणां। यत्कृत्तिकाः ॥

[†] Taitt. Br. i. 1. 2. 6 मुखं वा एतदत्वां यद्वसंतः।

¹ Taitt. San. vii. 4. 8 quoted infra.

the same thing may be said against placing the Krittikas in the autumnal equinox. Both the suggestions in my opinion are too extravagant to deserve any consideration. Nor can we assign the beginning of the Nakshatras to any random point in the ecliptic. There thus remain two possible explanations: viz., that the Krittikas coincided either with the winter solstice, or with the vernal equinox. Now, considering the fact that the vernal equinox is placed in the last quarter of Bharani in the Vedanga Jyotisha it is more natural to presume that the vernal equinox coincided with the Krittikas at the time when the Taittiriya Sanhita was compiled. But we need not depend upon probabilities like these, when there are other passages in the Taittiriya Sanhita and Brâhmana which serve to clearly define the position of the Krittikas in those days.

In the Taittiriya Brahmana (i. 5, 2, 7) it is stated that "the Nakshatras are the houses of gods.... the Nakshatras of the Devas begin with the Krittikâs and end with Vishâkhâ, whereas the Nakshatras of Yama begin with the Anurâdhâs and end with the Apa-Bharanîs."† Prof. Max Müller appears to think that the latter group is called the Nakshatras of Yama because Yama presides over the last of them. But the explanation appears to me to be quite unsatisfactory; for on the same principle the first group should have been called the Nakshatras of Indrâgnî, the presiding deities of

^{*} A similar mistake is committed by the late Krishna Shastri Godbole, in his essay on the antiquity of the Vedas, where he supposes Mrigashiras to be in the autumnal equinox. p. 20, 21.

[†] देवगृहा वै नक्षत्राणि ।....। कृत्तिकाः प्रथमं। विशासे उत्तमं। तानि देवनक्षत्राणि। अनुराधाः प्रथमं। अपभरणीक्तमं। तानि यमनक्षत्राणि। यानि देवनक्षत्राणि तानि दक्षिणेन परियंति। यानि यमनक्षत्राणि तान्युत्तरेण।

1 Prep. to Rig. Vol. IV. p. xxxi.

Vishâkhâ, the last in that group. I am, therefore, disposed to think that the principle of division in this case is the same as that followed in the case of the Devayana and the Pitriyana discussed before. We have the express authority of the Shatapatha Brâhmana stating that the sun was to be considered as moving amongst and protecting the Devas, when he turned to the north, in the three seasons of spring, summer and rains. In other words the hemisphere to the north of the equator was supposed to be consecrated to the Devas and the southern one to the Pitris. Now, the sun moved amongst the Devas when he was in the northern hemisphere. The Devas, therefore, must have their abode in that hemisphere, and as the Nakshatras are said to be the houses of the Devas, all the Nakshatras in the northern hemisphere, from the vernal to the autumnal equinox, would naturally be called the Nakshatras of the Devas. Now the southern hemisphere was assigned to the Pitris; but I have already quoted a passage from the Rigveda which states that it was the path of the god of death. In Rig. x. 14, 1, Yama is spoken of as the king of Pitris, and in verse 7 of the same hymn the deceased is told to go to the pitri-loka, where he would meet the god Yama. In the Vajasaneyi Sanhitâ 19, 45, salutation is made to the world of Pitris in the kingdom of Yama. There are many other passages of similar import in the Sanhitâs,* and from all these it would be quite clear that the Pitriyana or Pitri-loka was also called the kingdom of Yama. The Nakshatras in the southern hemisphere, therefore, came to be designated as the Nakshatras of Yama in opposition to the Nakshatras of the

[°] Cf. Taitt, San. vii. 3, 14. यमेन पितृन् राज्ञा मनुष्यान् (scil.) अन्यभवस् । Also see Athar. Ved. xviii. 4.

Devas, thus dividing the whole circle of stars in two equal groups. This also explains why Yama is made to preside over the Apa-Bharanis. It was at the Apa-Bharanis that the zodiac was divided, the Krittikas going over into the Devas' and the Apa-Bharanis turning down into the Yama's portion of the celestial hemisphere. The Taittiriya Brâhmana further states that the Nakshatras of the Devas move towards the south while the Nakshatras of Yama move towards the north. The words dakshina (south) and uttara (north) are in the instrumental case, and doubts have been entertained as to their exact meaning. But if we accept the statement in the Shatapatha Brâhmana about the abode of the Devas, no other meaning is posible except that the Nakshatras of the Devas were counted from the vernal to the autumnal equinox, that is, to the point where the south (southern hemisphere) begins, and conversely in case of the Nakshatras of Yama. I may here mention that the movements of both the groups are described in the Brâhmana in the present tense (pari-yanti), and that we may, therefore, suppose them to be recorded from actual observation. If this explanation of the division of the Nakshatras into the Nakshtras of gods and those of Yama is correct—and I think it is—it at once fixes the position of the Krittikâs at the beginning of the Devayana or the vernal equinox at the time when these Vedic works were compiled.

^{*} May not Apa-Bharanîs have been so named from this circumstance? Bharanî appears to be an older name, changed afterwards into Apa-Bharanî, in the same manner, Mula into Mula-barhanî, and Jyeshinâ into Jyeshinaghnî. Perhaps the description of Apa-Bharanî in Taitt, Br. i. 5, 1, may be so understood. It says:—

यमस्यापभरणीः। अपकर्षतः परस्तात्। अपवद्दतोऽबस्तात्।

There is another and still more important passage in the Taittirîya Sanhitâ which supplies further confirmatory evidence on the same point. In the Taittirîya Sanhitâ vii. 4, 8, we have a discussion as to the time best suited for the commencement of the Satras like the gavām-ayana which last for one whole year and as the passage is important in various ways I shall give it here in the original:—

संवरस्तायं दिक्षिष्यमाणाएकाष्ट्रकायां दिक्षरत्रेषा वे संवरस्तरस्य पत्नी यदेकाष्ट्रकेतस्यां वाष्ट्रष्ट्रताण् रात्रि वसित साक्षादेव संवरस्तामारभ्यं दिक्षंत्तायां वाष्ट्रवेत् संवरस्तरस्याभिद्धिते यएकाष्ट्रकायां दिक्षंतिनामानावृत् भवतोव्यस्तं वाष्ट्रते संवरसरस्याभिद्धिते यण्काष्ट्रकायां दिक्षं-तेतनामानावृत् भवतः फल्गुनीपूर्णमासे दिक्षेत्रन्मु खं वाष्ट्रतत् संवरसरस्य यस्फल्गुनीपूर्णमासो मुख्तप्व संवरसरमारभ्यं दिक्षेत् तस्यकेव नियां यत्साम्भेष्यं विष्ट्रवान्तसंपद्यते चित्रापूर्णमासे दिक्षेत्रन्मु खं वाण्ततसंवरसरस्य यिद्यत्राप्रणमासो मुखतप्व संवरसरमारभ्यं दिक्षेत्रेत तस्य न काचन नियां भवति चतुरहे पुरस्तात्पौर्णमास्य दिक्षेत्रेत स्था संपद्यते पूर्व-पक्षं मासांअभिसंपद्यते ते पूर्वपक्ष द्यात्ति तानुत्तिष्टत्योषध्यो वनस्पत् योन्तिष्ठति तान्कल्याणी क्रीतिरम्त्तिष्टरयरात्सुरिमे यजमानाइति तद्युसर्वे राध्यति ।

In the Tandya Brahmana (v. 9) we have the same passage with a few additions and alterations, and as this has been quoted by the commentators I shall give it here for comparison:—

एकाष्ट्रकायां दीक्षरन्॥१॥

एंचा वै संवत्सरस्य पत्नी यदेकाष्टकैतस्यां वाएता रात्रिं वसति - साक्षादेव तत्संदत्सरमारभ्य दीक्षेत ॥ २ ॥ तस्य सा निर्या यद्पोऽनिभनंदंतोऽभ्यवयंति 🕻 ३ ॥ विच्छित्रं वाप्ते संवत्सरस्याभिदीक्षंते यपुकाष्टकायां दीक्षंतेऽतनामाना-

वृत् भवतः ॥ ४ ॥

आर्त वापुते संवत्सरस्याभिदीक्षंते येंऽतनामानावृत् अभिदक्षिते॥ ५॥ तस्मादेकाष्टकायां न दीक्ष्यम्॥ ६॥

फाल्गुने दिक्षरन्॥ ७॥

मुखं वाएतत्संवत्सरस्य यत्फाल्गुनो मुखतएव तत् संवत्सरमारभ्य दीक्षंते॥ ८॥

तस्य सा निर्या यत्सम्मेघे विषुवान् संपद्यते ॥ ९ ॥

चित्रापूर्णमासे दीक्षेरन्॥ १०॥

चक्षुर्वाएतत् संवत्सरस्य यश्चित्रापूर्णमासो मुखतो वै चक्षुर्मुखतएव तत् संवत्सरमारभ्य दीक्षंते तस्य न निर्यास्ति ॥ ११ ॥

चतुरहे पुरस्तात् पौर्णमास्या दिक्षरन्॥ १२॥

तेषां पूर्वपक्षे सुत्या संपद्यते त्वैकाष्टकां न संवर् कुर्वति॥ १३॥ तेषां पूर्वपक्षे सुत्या संपद्यते पूर्वपक्षे मासाः संतिष्ठमाना यंति पूर्वपक्षेउत्तिष्ठांति तानुत्तिष्ठतः पशवः औषधयोऽन्तिष्ठति तानक्त्याणी वागभिवदस्यरात्सुरिमे सन्निणइति राष्ट्रवंति॥ १४॥

The third sûtra in the above gives an additional reason for rejecting the Ekâshtakâ; while in the fourth sûtra vichhinnam is substituted for vyastam of the Taittiriya Sanhitâ. Another important change is, that the word Phalgunî-pûrnamâsa is paraphrased by Phâlgunî in the 8th sûtra, thus clearly showing that the former was then understood to mean the full-moon night. Both the passages are similar in other respects.

Fortunately for us Sâyanâchârya is not our only guide in the interpretation of these important passages. It is probably the only passage (the two passages being similar I treat them as one) in the Vedas where the commencement of the annual satra is given and from the ritualistic point of view it has formed the subject of a learned discussion amongst the Mîmânsakas. Jaimini in his Mîmânsa-darshana Chap. vi. Sect. 5 has devoted an Adhikarana (10th) to the interpretation of this passage, and the subject has been thoroughly discussed by Shabara, Kumarila, Parthasarathi Khandadeva and other writers on Mimansa. We have thus a continuous tradition about the meaning of this passage current amongst the Indian divines—a tradition based not upon mere authority, but on the logically solid rules of exegetics propounded in the work of Jaimini. I shall first give a literal translation of the passage from the Taittiriya-Sanhità and then discuss its interpretation as bearing on the present question.

"Those who are about to consecrate themselves for the year (sacrifice) should do so on the Ekâshṭakâ (day). The Ekâshṭakâ is the wife of the year; and he [i. e., the year] lives in her [i. e., the Ekâshṭaka] for that night. (Therefore they) practically sacrifice (by) beginning the year. Those that sacrifice on the Ekâshṭakâ, sacrifice to the distressed (period) of the year. It is the season (dual) whose name comes last. Those, that sacrifice on the Ekashṭakâ, sacrifice

^{*} The Tandya Brahmana, (Sútra 3 in the above passage) adds a third reason thus:—" They go to avabhritha [i. e., the final bath] not delighted with water." Shahara and other commentators on Jaimini bave noticed this additional ground for rejecting the Ekashtaka.

to the reversed* (period) of the year. It is the season (dual) whose name comes last. They should consecrate themselves for the sacrifice on the Phalgunî full moon. The Phalgunî full-moon is the mouth of the year. They sacrifice (by) beginning the year from the very mouth. It has only one fault, viz., that the Vishûvân [i.e., the equator or the central day] falls in the rains. They should consecrate themselves for the sacrifice on the Chitra full-moon. The Chitrà full-moon is the mouth of the year. They sacrifice (by) beginning the year from the very mouth. It has no fault whatsoever. They should consecrate themselves for the sacrifice four days before the full-moon. Their Kraya [i.e., the purchase of soma] falls on the Ekashtaka. Thereby they do not render the Ekashtaka void [ie., of no consequence]. Their Sutya [i.e., the extraction of soma juice] fails in the first [r.e., the bright] half (of the month). Their months [i.e., the monthly sacrifices] fall in the first half. They rise [i.e., finish their sacrifice] in the first half. On their rising, he rbs and plants rise after them. After them rises the good fame that these sacrifices have prospered. Thereon all prosper."

Here in the beginning we are told that the Ekâshtakâ is the day to commence the Satra, which lasts for one year. But the word Ekâshtakâ is used to denote the eighth day of the latter (dark) half of the four months of Hemanta and Shishira seasons,† and sometimes it means the eighth day of the

^{*} According to the Tandya Brahmana "broken" or "destroyed."

[†] Cf. Ashv. Gri. Sutra ii. 4, 1; हेमंत्रशिशिश्योश्चतुर्णाभपरपश्चाणाम-ष्टमाष्वष्टकाः।

dark half of each of the twelve months of the year.* The statement in the following sentences that this Ekashtaka is liable to the objection of occurring in the cold or the last season does, however, at once narrow the field of our choice. It must be further borne in mind that the Ekâshtakâ, here spoken of, is the wife of the year, and is contrasted with the Phalguni and Chitrà full-moons; while tradition in the time of Jaimini and Apastamba interpreted it to mean the 8th day of the dark half of Magha. All writers on Mimansa therefore take this Ekashtaka to mean the 8th day of the dark half of Magha. As the Ekashtaka is the wife of the yeart and as the god of the year is said to reside with her on that night, those that commence their sacrifice on that Ekashtaka may practically be supposed to commence it at the beginning of the year which resides there. In other words the Ekashtaka is thus a constructive beginning of the year, and therefore the yearly sacrifice may be commenced on that day. But the passage now proceeds to point out the objections to the commencing of the sacrifice on the Ekashtaka day. The 8th day of Magha falls during the distressed period of the year, that is, according to Shabara and other commentators the period

^{*} Cf. Tandya Brahmana x. 3, 11. द्वाद्शेडाष्ट्रका: द्वाद्शामावास्या: | Sayana in his commentary on Tan. Br. v. 9, observes that Ekashtaka is there used in its secondary sense and quotes Apastamba Grihya Sutra (viii. 21, 10) thus:— या माध्या पौर्णमास्या उपरिष्टाद्यष्ट्रका तस्याष्ट्रमी ज्येष्ठय संपद्यते | तामेक्ष्टकेत्याचक्षते | Thus both Jaimini and Apastamba considered Ekashtaka to mean the 8th day of the dark half of Magha.

[†]Shabar on Jaimini vi. 5, 35, quotes Atharva Veda iii. 10, 12; and Sayana in his Comm. on Taitt. San. vii. 4, 8, cites, Atharva Veda iii. 10, 12, and Taitt. San. iv. 3, 11, 3. But these texts simply state that the Ekashtaka is the wife of the year, without defining the Ekashtaka.

when people are distressed by cold.* The word in the text is ârta which literally means 'distressed,' but Sâyana takes it to denote the end or destruction of the year, implying thereby that the old year is then brought to an end and that the consecration for the yearly satra, which must be made before the beginning of the new year, or, in other words, not alter the previous year is ended or destroyed, cannot be made at this time. Though Shabara and Sâyana thus give different interpretations of ârta, practically both agree in holding that in those days the old year ended before the eighth day of the dark half of Magha; for Shabara distinctly states that the word "reversed" used further on means "reversed on account of the change of ayana."† Sacrificing during the distressed period of the year is thus the first objection to commencing the satra on the Ekashtaka day. The second objection is that it is the last season, that is, though you may be said to sacrifice to the constructive beginning of the year, yet as far as the seasons are concerned you sacrifice in the last of them. The word for season, ritu, has been used in the text in the dual number and it might be urged that it denotes two seasons. A reference to the Taittiriya Sanhit& iv. 4-11, 1. will, however, show that the word ritu is there used in dual, probably because each season comprises two months, I just as "scissors" is used in plural in English.

^{*} आर्ता यश्मिन्काके भवाति स आर्तः कालः, शतिन च आर्ता भवंति। Shabara on Jaim. vi 5. 37. Sayana आर्तमाभिविनाशमाभिलक्ष्य दीशंते।

[:] मधुक्ष माधवश्र वासंतिकावृत्। Upon this passage the author of Kala-Madhava observes द्विचनं ऋरववयवसासासिपायस्। Cal. Ed., p.59

A similar passage also occurs in the Vajasaneyi Sanhita (13-25) and Mahidhara while commenting on it expressly states that the dual there has the meaning of the singular number.* The "last named seasons (dual)" therefore simply means "the last season." It must be here mentioned that according to the passage in the Tandya Brahmana, which Shabara appears to quote, the first objection is thus stated:-"not delighted with water they go to avabhritha [i. e., the final bath]." This is but an amplification of the objection on the ground of the "last season" and Khandadeva expressly says that water is then undelightful "on account of cold." The Tandya Brahmana does not omit the objection of the "last season;" but simply expands and illustrates the same by referring to the natural dislike for a cold bath in that season. We may, therefore, regard this objection more as explaining the first than as an additional one. We now come to the third objection, viz., those that commence the sacrifice on the Ekashtaka day sacrifice to the reversed period of the year. Reversed', vivista in the original, is said by Shabara to indicate the change of ayana caused by the turning away of the sun from the winter solstice,† and Sayana seems to understand it in the same way. Thus although those that commence the satra on the 8th day of the dark half of Magha may be supposed to do so practically at the beginning of the year, the husband of the Ekashtaka, yet the procedure is triply objectionable, inasmuch as they sacrifice in the cole season, in the last of seasons (when water is undelightful and when the year is reversed or upset by the turning away of the sun from the winter solstice.

[•] द्विचनमेकवचनार्थम्।

f See Shabara quoted in the second note on the last page.

To get over this threefold objection an alternative is next proposed. The Phalguni full-moon day was known to be the first day of the year. If you commence your sacrifice on that day, you avoid the three objections previously noted and still secure your object of sacrificing at the beginning or the mouth of the year. But even this course is not faultless; because if you commence on the Phalguni full-moon the middle or the central day of the satra falls in the rainy season, which again is not a desirable time. The first twelve days of a satra are taken up in the consecration and twelve more in upasads after which the regular satra sacrifices commence. So the middle day of the satra falls after six months and twenty-four days from the Phalguni full-moon, that is, on the ninth of the bright half of the month of Âshvina Now if we suppose the winter solstice or the beginning of the cold season to fall on the Magha fullmoon, the summer solstice, or the end of the summer and the beginning of the rainy season, would fall a little after the full-moon in Shravana. The months of Bhadrapada and Ashvina therefore represented the rainy season in those days, and the occurrence of the Vishûvân in Ashvina or the rainy season was not believed to be auspicious. As the next alternative it is, therefore, suggested that the consecration should take place on the Chitrà full-moon, and this course is said to be open to no objection whatsoever.

But even this is given up for a still better time, and it is finally stated that persons desirous of consecrating themselves for the satra should do so "four days before the full moon." The full-moon here mentioned is not, however,

^{*} This, in substance, is Sâyana's explanation in his commentary on this passage.

specifically defined, and consequently it forms the subject of one of the Jaimini's Adhikaranas.* As no specific fullmoon is mentioned it may mean either any full moon-day, or the Chitrâ full-moon which is mentioned next before in the same passage, or it may refer to the Magha full moon as the Ekashtaka is mentioned immediately afterwards in connection with it. Jaimini decides that it is the full-moon in the month of Magha, for it is stated immediately after, that those who commence the sacrifice on this full-moon will purchase their Soma on the Ekashtaka. This Ekashtaka can evidently be no other than the one mentioned in the beginning of the passage, and the object of the arrangement last suggested is to utilise somehow or other the important day of the Ekashtaka, which was at first recommended for the commencement of the sacrifice itself, but which had to be given up on account of the three-fold objection stated above. The full-moon must, therefore, be the one next preceding this Ekashtaka. Again the full-moon day is said to be such that when the sacrifice is finished the herbs and the plants spring up, which, as remarked by Shabara, can happen only in the Vasanta season.

Jaimini vi. 5, 30-37. Jaimini's Butras which i have here tried to translate and explain are as follows:—1. पौर्णमास्वामनियमोऽवितेवात्; 2. आनंतर्यात् चेत्री स्यातः; 3. माधी बेकाष्ट्रकाश्रतेः; 4. अन्याऽपीति
चेतः; 5 न मक्तिस्वादेवा हि डोके; 6. दीक्षापराभे चानुमहातः; 7. स्टबावे
चानुमरोहातः; 8. अस्यां च सर्वेद्धिगानि. Sayana in his Jaimini nyayamala vistara and in his comm. on the Taitt. San. fully adopts this view. But in his somm. on the Tandya Brahmana, v 9. 12 (Cal. Ed.) he is represented as saying that the full moon last mentioned refers to the Chaitri! S me one, either the scribe the printer, or the publisher, has here obviously committed an error.

To sum up; the last mentioned full-moon, though not specifically defined, must be prior to the Vasanta season and also the next previous to the Ekâṣhṭakâ, which is the wife of the year and which fails in the cold season, in the last season, i e.. Shishira [or when water is not delightful] and after the sun has passed through the winter solstice. It must also be remembered that the Phalguni and the Chitrâ full-moon are to be excluded. Jaimini, therefore, concludes that this full-moon cannot be any other than the one falling in the month of Mâgha, and his conclusion has been adopted by all the Mimânsakas. We can now understand why Laugâkṣhi, quoted by Somîkara, states that "they sacrifice to the year four days before the full-moon in Mâghu."

If Jaimini's interpretation of this passage is correct, we may, so far as our present inquiry is concerned, deduce the following conclusions from it: -(1) That in the days of the Taittiriya Sanhita the winter solstice occurred before the eighth day of the dark half of Magha, which again was a month of the cold season. Whether the solstitial day fell on the Magha full-moon is not so certain, though it may be taken as fairly implied. For the Ekashtaka was abandoned because it occurred in the "reversed" period of the year, and it is quite natural to suppose that the priests in choosing a second day would try to remove as many of the objections to the Ekâshtakâ as they could. In other words, they would not select a day in the "reversed" period of the year, nor one in the last season. The fact that a day before the fullmoon in Magha was selected is, therefore, a clear indication of the solstice occurring on that day, while their anxiety

^{*} माध्याः पौर्णमास्याश्रत्रहः पुरस्तात्संवत्सराय दीक्षते।

to utilise the Ekashtaka fully accounts for the selection of the fourth in preference to any other day before the full-moon. I may also remark that throughout the whole passage the intention of sacrificing at the beginning (real, constructive, or traditional) of the year is quite clear. The full-moon-in Magha must, therefore, have been one of such beginnings. (2) That the year then commenced with the winter solstice. (3) That as there cannot be three real beginnings of the year at an interval of one month each, the passage must be understood as recording a tradition about the Chitra full moon and the Phalguni full-moon being once considered as the first days of the year. (4) That Vishuvan had lost its primary meaning and that it fell in the rainy season if the sacrifice was commenced on the Phalguni full-moon.

The passage thus supplies not only confirmatory, but direct evidence of the coincidence of the Krittikas with the vernal equinox in the days of the Taittirîya Sanhitâ. For, if the winter solstice fell on the full-moon day in Magha, then the summer solstice, where the moon must then be, must coincide with the asterism of Magha, and counting seven Nakshatras backwards we get the vernal equinox in the Krittikas. Independently of the Vedanga Jyot.sha we thus have four different statements in the Taittiriya Sanhitâ and Brahmana clearly showing that the vernal equinox was then in the Krittikas: firstly, the lists of the Nakshatras and their presiding deities, given in the Taittirîya Sanhitâ and Brâhmaṇa, all beginning with the Krittikas; secondly, an express statement in the Taittiriya Brâhmana, that the Krittikas are the mouth of the Nakshatras; thirdly, a statement that the Krittikas are the first of the Deva Nak-

shatras, that is, as I have shown before, the Nakshatras in the northern hemisphere above the vernal equinox; and fourthly, the passage in the Taittiriya Sanhita above discussed, which expressly states that the winter solstice fell in the month of Magha. The vernal equinox is referred to the Krittikas directly or indirectly in all these passages and I do not think that any more confirmatory evidence from the Vedic works is required to establish the proposition that the Krittikas coincided with the vernal equinox, when the Taittiriya Sanhitâ was compiled. As an additional proof I may, however, mention the fact, that Pitris are said to be the presiding deities of Magha in the Taittiriya Sanhità iv. 4. 10. 1. With the Krittikas in the vernal equinox Magha is the summer solstice and as the Dakshinayana or the ayana of the Pitris commenced at this point, the asterism which happened to be there at that time was naturally assigned to the Pitris. The position for all the other cardinal points of the ecliptic can be thus shown to be consistent with the position of the vernal equinox in the Krittikas.

Supposing the Krittikas to denote the asterism of that name this gives us, according to Prof. Whitney's calculation, 2350 B. C. as the probable time for the compilation of the Taittiriya Sanhità. Some scholars unwilling to carry the antiquity of the work to such a remote period, have urged, without assigning any special reason, that by Krittikàs we must here understand the beginning of the zodiacal portion of that name. Now as the position of the asterism of the Krittikâs in its zodiacal portion is 100 50' from the beginning,† these scholars would place the vernal equinox

[·] See Surya Siddhanta Add. notes, p. 323.

[†] This is the position given in the Surya Siddhanta viii. 29. See the table prepared by Prof. Whitney in his notes to this passage

about 11° behind the asterism of the Krittikas and thus reduce the antiquity of the Sanhità nearly by $11 \times 72 = 792$ years or to about 1426 B. C. I have briefly stated before my reasons for discarding this supposition and holding that the names of the Nakshatras in the early Vedic days must be taken to denote the asterisms known by such names. If Indian priests are to be supposed incapable of making any accurate observations of solstitial points in 1200 B.C, † it is to my mind utterly inconsistent and illogical to hold that the forefathers of these priests, when they assigned the vernal equinox to the Krittikas, understood the word to mean not the asterism but the imaginary beginning of the modiacal portion of that name. I cannot also understand why scholars should hesitate to assign the Vedic works to the same period of antiquity which they allow to the Chinese and the Egyptians. I But it is needless here to enter into this controversy. For if I once succeed in showing, as I hope to do that there is sufficient internal evidence in the Vedic literature itself of a still remoter antiquity, all theories, conjectures, and guesses, which have the effect of unduly reducing the antiquity of the Vedic works and also of throwing discredit upon the claims of the Indians to the origin of the Nakshatra system, will require no refutation.

[.] This is Bentley's date about which see in fra.

⁺ See Pref. to Rig., vol IV., p. xxix.

M. Biot allows it in the case of the Chinese and considers that the Hindus borrowed the Nakshatra system from them. Albirunt, in his chronology of ancient nations, &c., observes that other nations begin their asterisms with the Pleiades. He further states that he has found in some books of Hermes that the vernal equinox coincides with the rising of the Pleiades, but, says he "God knows best what they intend!"

Bentley, however, takes his stand on a different ground. He suggests that the word Vishakha, like Vidala, may mean "possessed of two branches," and that these two branches may have been caused by the equinoctial colure bisecting the zodiacal pertion of the Vishakhas. Now the equinoctial colure passing through the beginning of the divisional Krittikas naturally bisects the zodiacal portion of Vishakha. Bentley, therefore, concludes, without any more proof than this etymological conjecture, that this was the position of the colure when Vishakha received its name. This is no doubt an ingenious hypothesis. But there is not only no evidence in the Vedic works to suppert such etymological speculation, but it may be easily shown to be inconsistent with the position of the winter solstice in the day of the Taittiriya Sanhita.

I have already stated that from the passage of the Taittiriya Sanhità just quoted we may fairly infer that the winter solstice occurred in those days on the full moon in Mâgha According to the Vedánga Jyotisha it feil a fortnight earlier, that is, on the first day of the bright half of Mâgha. It is roughly estimated that the equinox must recede about two divisional Nakshatras, ie., 26° 40′, to make the seasons fall back by one month. Between the times of the Taittiriya Sanhità and the Vedânga Jyotisha the equinox must accordingly recede 13° 20′ or nearly 14°. Now the position of the equinox as given in the Vedânga Jyotisha is 10° of Bharanî. From this to the beginning of the divisional Krittikâs, the distance is only 3° 20′, while if we measure it from the asterism of Krittikâ it is 3° 20′+10°

^{*} This example has been added by Prof. Max Muller. See Pref. to Rig., Vol. IV., p. xxx. See also Bentley's Historical view of Hindu Astronomy, p. 2.

the Taittirîya Sanhitâ and the Vedânga Jyotisha the equinox, according to Bentley, receded only 3° 20'; while if we understand the Krittikâs to denote the asterism of that name, it gives us a precession of 14° 10'. Now as the winter solstice fell a fortnight later in the days of the Sanhitâ we must accept the latter precession of 10°, which alone corresponds with that interval of time (i. e. a fortnight) and assume that the vernal equinox then coincided with the asterism of Krittikâ, a conclusion the probability of which has already been established on other grounds. Bentley's speculation must, therefore, be rejected, unless we are prepared to allow his guess about the primary meaning of Vishâkhâ to prevail against reasonable conclusions based upon a passage from the Taittirîya Sanhitâ.

But even admitting Bentley's speculation about the meaning of Vishâkhâ, we may fairly question the soundness of the conclusion drawn therefrom. For what ground is there for holding that the two divisions of Vishâkhâ must be mathematically equal in every respect? The word dala in vidala may be so understood; but dala and shâkhâ are not similar in this respect. Bentley's error, therefore, consists not in supposing that the colure may have cut the divisional Vishâkâs, but in inferring therefrom that it must have bisected it. The whole ecliptic was divided into 27 Nakshatras, and $13\frac{1}{2}$ could only be comprised in each hemisphere. Vishâkhâ, the 14th Nakshatra from the Krittikâs, may have been thus considered, by simply counting the number of the Nakshatras, as lying partly in the region of the Devas and partly in that of the Pitris.

^{*} This is enough to satisfy a merely etymological speculation us supported by any other evidence whatsoever. Speaking more

For though we might hold that the Vedic observers were not provided with means to fix imaginary points in the heavens and to refer to these points the motions of the heavenly bodies as astronomers do at present, yet it does not imply that they were unaware of the approximate distances between the various asterisms selected by them. In other words, they might be supposed to have roughly known the distances between the stars, though for obvious reasons they could not but refer the motions of the heavenly bodies only to the fixed stars. Thus understood, Bentley's conjecture about the primary meaning of Vishakha does not necessarily imply that the equinoctial colure bisected the divisional Vishâkhâs in those days; and when the conjecture itself does not thus support his theory about the position of the colure, I do not think we shall be justified in accepting it, especially when it is shown that it is also objectionable on other grounds. I am, therefore, disposed to fix the date of the Taittiriya Sanhitâ at 2350 B.C., and not 1426 B. C. as Bentley has done.

accurately if the vernal equinox coincided with the asterism of the Krittikâs, the equinoctial colure falls out of the divisional Vishâkas by 40, but it is nearly 60 behind the asterism of Anurâdhâ. Of these two asterisms Vishâkhâ would therefore be nearer to the colure. But we might as well ask what ground there is for holding that the Nakshatra divisions of the Zodiac, at the time when the vernal equinox was in the Krittikâs (supposing such divisions to have then existed), were the same as those which we now use and which commence with Revati. Bentley appears to have altogether overlooked this objection. I have already stated my view regarding the existence of the divisional Nakshatras in old times, and I would reject Bentley's etymological speculation on the mere ground that it requires us to assume the existence of such divisional Nakshatras and their bisection by colures.

So far, we have been going over the ground more or less. traversed before by several scholars. But it may be asked if we have here reached the Ultima Thule of the Vedic antiquity. Does the oldest hymn, the first utterance of the Aryan mind, reach back thus far and no further? Was it such a hymn that the Brahma-vâdins of old and Pânini several centuries before Christ believed and declared as "seen"? In what follows, I propose to bring together such evidence from the Vedic works as would enable us to deal with these questions. I have already drawn attention to the fact that the Chitrà and the Phalguni full-moon are mentioned as the mouths or the beginnings of the year in the passage from the Taittiriya Sanhità last quoted and discussed. In the next chapter I shall endeavour to show how these statements are to be interpreted, how far they are corroborated by other evidence and what conclusions we may deduce therefrom.

CHAPTER IV.

AGRAHÂYANA.

Fhálguni full-moon, the new year's night-Sâyana's explanation un. satisfactory—Phâlguna could not be a Vasanta month—Two fold character of the seasons, lunar and solar, superfluous-Discussion of a passage in Shushruta—Bhaskara Bhatta's explanation.-Winter solstice on the full moon in Phalguna-The position of other cardinal points Vernal quinox in Mrigashiras-Agrahayant-Native Lexicographers' explanation of the word—Grammatically objectionable - Its real meaning according to Panini - Erroneous rank of Margashirsha amongst months according to the Bhagavad Gita and Amara-Margashirsha could not have been the first month of the solistitial or the equinoctial year-It leads to the libration of the equinoxes—Possible reason of the libration theory-Mrigashiras-Agrahâyana or the first Nakshatra in the year-Mula, its primary meaning-Evidence of the summer solstice occuring in Bhâdrapada-Origin of the annual feasts to the manes amongst Hindus and Parsis-Comparison of the primitive Hindu and Parsi calender-Summary of results.

The passage from the Taittiriya Sanhitâ quoted in the last chapter states that the Chitrâ and Phalguni full-moons were the beginnings of the year, which then commenced with the winter solstice in the month of Mâgha. The words used in the original are Chitrâ-purna-mâsa and Phalguni pûrna-mâsa and these must be understood to denote, not the Chaitra and the Phâlguna months, whether sidereal and synodical, as Prof. Weber seems to have, in one case, supposed, but the full-moon days in each of these months. This is evident from the fact that these have been recommended as alternative times for the commencement of the satra in opposition to the Ekâshtakâ day. In the case of the Phalguni-pûrna-mâsa we are further told that Vishûvân

counted from that time falls during the rainy season, and it is impossible to suppose that Vishûvân can be counted from a month. The whole context therefore, shows that it is a discussion as to the particular day best suited to commence the yearly sacrifice, and that Chitrâ-pûrn i-mâsa and Phalguni-pûrna mâsa must mean the days when the moon is full near the asterisms of Chitrâ and Phalguni. In the Tândya Brâhmaṇa Phalguni-pûrna-mâsa is rendered by Phâlguni and Jaimini has paraphrased Chritâ pûrna-mâsa by Chaitri and Phalguni and Chaitrî, according to Pâṇini (iv. 2. 3), are the names of days. These interpretations have been accepted by all the Mimânsakas including Sâyaṇa, and we may do the same especially as there are several passages in the Taittiriya Sanhità where pūrna-mâsa is used in a similar sense.†

But why should the Chitrâ and the Phalgunî full-moon be called the beginnings of the year? Sâyaṇa thinks that they were so described because they occurred during Vasanta or the first of the seasons. I But the explanation does not appear satisfactory. I have previously shown that according to all astronomical works Shishira commenced with the winter solstice, and that the three seasons of Shi-

^{*} See the passages quoted in the last chapter.

^{† 1}n Taitt. San. ii 2. 10. 1. we find तिच्यापूर्णमास similarly used.] In i. 5. 10. 3. दशपूर्णमासों are mentioned together; while in ii. 5. 4.

^{1.} पूर्णमास and अमावास्या are contrasted.

In his commentary on Taitt. San. vii. 4. 8. speaking of फंस्ंगुनीपुणंमास Sayana observes तस्य च भविसंवत्सरोपक्रमाद्देनत्वात्। एतदेवाभिन्नेत्याधानब्राह्मणे समाम्नातं। उत्तरयोरादधीत। एषा व प्रथमा रात्रिः
संवत्सरस्य यदुत्तरे फल्गुनीति।; while of चित्रापुणंमास he says:-सोऽपि
वसंतर्नुमध्यपातित्वासंवत्सरस्य मुखमेव।

shira, Vasanta and Grishma were comprised in the Uttarayana as it was then understood. Now in the days of the Taittirîya Sanhitâ the winter solstice, as shown in the last chapter, se'll in the month of Magha; and Magha and Phâlguna were therefore comprised in Shishira, and Chaitra and Vaishakha in Vasanta. But ın order that Sayana's explanation might be correct Phalguna must fall in the Vasanta season which, as a matter of fact, it did not. In his commentary on the Baudhayana Sûtras* and also in the Kâlamâchavat Sayana tries to get over this difficulty by proposing a double Vasanta-lunar and solar, the lunar to include the months of Phalguna and Chaitra, and the solar those of Chaitra and Vaishakha, quoting amongst others, Rig. x., 85, 18, as an authority to show that the seasons were regulated by the moon. The authorities, however, are not explicit and therefore sufficient to maintain the two-fold character of the seasons; nor do I see the necessity of the two-fold character. It is true that the months in the calendar were all lunar, but the concurrence of the lunar and the solar year was always secured by inserting an intercalary month whenever necessary. Under such a system lunar seasons can have no permanent place. Now and then lunar months ceased, as they now do, to correspond with the

^{*} The passage is quoted in India: what it can teach us? p. 323; Sâyana there quotes Taitt. San. vii. 4. 8., and after noticing that the Chitrâ and the Phalguni full moon are both said to begin the year, he observes:—अथवा फाल्गुनश्चेत्रो वंतत: मुखं वा एतःसंवः मरस्य यत्फाल्गुनीपूर्णमास हाते श्रुते: । एवं च सीरचांद्र भेदिभन्नं वंततद्वयमुपसंगृहीतं भवति । The theory of the two-fold seasons thus appears to have been started simply to reconcile the two statements about the Chitrâ and Phalguni full moons.

[†] See Cal. Ed., pp. 60, 61.

seasons they represented, but this was at once set aright by the introduction of an intercalary month. If we, therefore, exclude the correction due to the precession of the equinoxes, which was too minute to be noticed till after hundreds of years, there was thus no reason why the lunar seasons should come to be regarded as a permanent institution. But even accepting Sayana's two-fold character of the seasons, it can be easily shewn that it does not support his conclusions. A lunar year is shorter than a solar year by 11 days. If the solar Vasanta, therefore, commences on the 1st day of the lunar Chaitra month this year, it will commence on the 12th day of Chaitra (lunar) next year and 11 days later still in the third year when by the introduction of an intercalary month the commencement of Vasanta will be again brought back to the 1st day of Ohaitra. The twofold character of the seasons may thus delay the beginning of Vasanta to Vaishakha (lunar), but the season cannot be accelerated and brought back to Phalguna. It is true that in the day of Sâyana (14th century) Vasanta commenced, as it does now, in the month of Phalguna; but it was so because the winter solstice had receded by over full one month by that time. Sayana does not appear to have fully realised the reason of this change and combining the occurrence of Vasanta in Phâlguna in his time with the occurrence of the same season in Chaitra in the days of the Taittiriya Sanhità and other works he attempted to reconcile the difference on the theory of the two fold character of the seasons. But we can now better understand the change as due to the precession of the equinoxes, and must, in consequence, reject Sayana's explanation as unsatisfactory.

The only other authority I can find for supposing that Phâlguna was a Vasanta month is the statement in Shu-

shruta's medical work, that "Phâlguna and Chaitra make Vasanta." But on a closer examination of the passage wherein this sentence occurs, it will be found to bear on its face the marks of later insertion. There are two consecutive paragraphs in Shushruta, each enumerating and describing the seasons of the year. The first states that "There the twelve months, beginning with Magha, make six seasons, comprising two months each. They are Shishira, &c.....Of these Tapa and Tapasya make Shishira" and so on until all the six seasons in their usual order, the ayanas, the year and the lustrum are described; and at the end we have "this is called the wheel of time by some." • The second paragraph then begins with the words "But here" and continues to state "But here the six seasons are.— Varshâ, Sharad, Hemanta, Vasanta, Grishma and Pravrish," thus altogether dropping Shishira and dividing the rainy period into two seasons Varsha and Fravrish. The paragraph then proceeds to assign the months to the seasons as follows:--"Bhâdrapada and Ashvina is Varshà, Kartika and Mârgashîrsha is Sharad, Pausha and Mâgha is Hemanta, and Phâlguna and Chaitra is Vasanta;" and so on until

^{*} See Shushruta, Sutrasthâna Adhyâya 6 The two consecutive paragraphs here referred to are:—

तत्र माधादयो द्वादश मासा द्विमासिकमृतं कृत्वा षड्ऋतवो भवति। ते शिशिरवसंतग्रीष्मवर्षाशरद्धेमंताः। तेषां तपस्तपस्यो शिशिरः। अयने द्वे भवतः। इक्षिणमुत्तरं च। तयोदिक्षणं वर्षाशरद्धेमंताः . . . । स एष निमेषादियुगपर्यतः कालश्रकवरपरिवर्तमानः कालचक्रमुच्यत इत्येके।

इह तु वर्षाश्वरद्रमंतवसंतग्रीष्मप्रावृषः षड्तवा मवंति।..। ते तु भाद-पदाचन द्विमासिकेन ग्वाख्याताः। तथ्या। भाद्रपदाश्वयुजी वर्षाः। कार्तिक-मार्गश्ची शरत्। पौषमाचौ हेमंतः। फाल्गुनश्चत्रो वसंतः। वैशाखाचे देर प्रीष्मः। आषादश्चावणौ प्रावृहिति।

all the months are assigned to their respective seasons. The second paragraph, however, makes no mention of the ayanas, the year, or the lustrum. It is therefore evident that the writer of the second paragraph, whosoever he may be, wished to note that the seasons and their corresponding months mentioned in the first paragraph had ceased to represent the actual state of things in the writer's time and province, and not thinking it desirable or possible to expunge or correct the old paragraph, he added immediately after it a second paragraph describing the seasons as he saw them. The words "but here" at its beginning, the assignment of four months to the rainy season, but under two different names of Pravrish and Varsha, to keep up the old number of the seasons, and the absence of any reference to the ayanas, the year and the lustrum described in the previous paragraph—all point to the conclusion that the second paragraph is of later origin and inserted with a view only to note the changes in the occurrence of events described in the paragraph next preceding it. It might be contended that the second paragraph is that of Shushruta, who notices the old order of things in the first. But I need not go into that question here. For in either case it is plain that the passage wherein Phâlguna and Chaitra are assigned to Vasanta is the production of a later writer, whosoever he may be whether Shushruta or any one else, and as far as our present inquiry is concerned we cannot take the passage as an authority for holding that Phalguna was a Vasanta month in the days of the Taittiriya Sanhita. I may however remark, that Vâgbhata who professes to summarise the works of Shushruta and Charaka gives the order and description of seasons as we find it in the first paragraph in Shushruta,* without alluding

[&]quot;Ashtangahridaya Sutrasthana iii.1., " मासिद्धिंसंख्येनीघायै: ऋमात् षड्तव: स्पृता: । शिशिरोऽथ...।"

to the changes noted in the second paragraph. We may, therefore, suppose that either the paragraph did not exist in Vâgbhata's time or that he did not regard it as genuine.

There is thus no reliable authority, that I am aware of, for holding that Phâlguna, in the days of the Taittirîya Sanhitâ, was a Vasanta month, and Sâyana's explanation does not in consequence hold good at least in this case. The explanation is further inconsistent with the fact that in several Brâhmanas and Sûtras the full-moon night in the month of Phâlguna has been pronounced to be the first night of the year. The Shatapatha Brâhmana (vi. 2. 2. 18) says "the Phâlgunî full-moon is the first night of the year." The Taittiriya (i. 1, 2, 8) and the Sânkhyâyana (iv. 4 and v. 1) Brâhmanas contain similar passages, while the Gopatha Brâhmana (i. 19) after stating that the Uttarâ and the Pûrvâ Phalgunî are respectively the beginning and the end of the year, adds "just as the two ends of a thing meet so these two termini of the year meet together."† I have already quoted a passage from the Tandya Brahmana to the same effect. The Sûtra-writers, though not so explicit, do however distinctly state that the annual sacrifices "should be commenced either on the Chaitrî or the Phâlgunî full-moon night,"‡ thus clearly indicating that these were regarded as the beginnings of the

year. If these passages mean anything, we must hold that the Phâlgunî full-mocn night was once considered to be actually the first night of the year, or to put it in a modern form the new year's night. We cannot assign this position to it by simply assuming, as Sâyana has done, that the night occured sometime during the two months of Vasanta. Sâyana, it appears, was aware of this objection and so in commenting on the passage from the Taittirîya Sanhitâ, quoted in the last chapter, he attempts to explain the position of the Phâlguni night by reference to the above mentioned passages in the Brahmanas; while with respect to the Chaitri, he quietly observes that "this too is the mouth of the year as it falls during the season of Vasanta."* But an explanation that admittedly fails in one case must fail in the other, for the Chitrâ and the Phâlgunî nights are described together, in the same passage and in the same words, as the beginnings of the year.

It will be clear from the above, first, that the theory of the lunar seasons, started by Sâyaṇa to account for the position assigned to the Phâlgunî night in the Vedic works, cannot have a permanent place in the Vedic calendar; secondly, even accepting the theory, the beginning of the solar Vasanta might be put off to the month of (lunar) Vaishâkha, but could not be brought back to any day in Phâlguna; and thirdly, the express texts in the Brâhmaṇas declaring the Phâlguni full-moon to be the new-year's night are inconsistent with Sâyaṇa's explanation. We must therefore look for some other solution.

But if Sâyana's explanation cannot be accepted, at

^{*} See the original remark quoted supra. The word "too" in this explanation implies that it holds good also in the case of the Phalguni full-moon.

least with respect to the Phâlgunî night, how are we to interpret the several passages in the Sanhita and the Brâhmanas given above? We cannot suppose that the Phâlgunî full-moon commenced the year at the verna! equinox; for then we shall have to place the vernal equinox in Uttarâ Bhâdrapadâ, which to render possible in the pre-Krittika period we must go back to something like 20,000 B. C. The only other alternative is to make the full-moon commence the year, at the winter solstice, and from the fact that the Mâghî, the Phâlgunî and the Chaitrî full-moons are mentioned together in the same passage of the Taittiriya Sanhitâ, and for the same purpose, I conclude that this is the real meaning of the passage in the Taittiriya Sanhitâ and those in the Brâhmanas. It is the most natural and reasonable interpretation of the passage and I find that Bhâskara Bhatta, who is older than Sàyana, fully adopts this view in his Bhâshya on the Taittiriya Sanhitâ. I have

^{*} A MS. of Bhâskara Bhatta's Bhâshya on the Taittirîya Sanhitâ has been recently discovered at Mysore and through the kindness of Sir Sheshâdri Iyar, the Dewan of Mysore, I have been able to procure a copy of the Bhashya on the passage here discussed. Bhaskara Bhatta after commenting on the first part of the passage which states that the sacrifice should be commenced on the Ekâshtakâ day, makes the following observation as regards the alternative next proposed :- एवं दूषियत्वा पक्षांतरं परिगृण्हाति । फल्गु-नीपूर्णमास इत्यादि। फल्गुन्या युक्तः पूर्णमासः फल्गुनीपूर्णमासः। मुसं वा इति। अत्र केचिदाहुः फाल्गुनादिः संवत्सर इति। तनमते मुस्तत एव संव-त्सरं परिगृद्ध दक्षि। कृता नविति। As regards the third alternative pro. posed in the text, viz. the Chitra full-moon Bhaskara Bhatta observes further on:-अतः पक्षांतरं परिगृण्हात । चित्रापूर्णमास इत्यादिगतं। चैत्रादिः संवत्सर इति येषां मतं तत इदानीमृच्यते i Finally Bhûskara Bhatta follows Jaimini and Shabara in the interpretation of the last part of the passage and concludes by observing the best time for the sacrifice is 4 days previous to the full-moon in Magha.

however devoted so much space to the discussion of Sayana's explanation as the high authority of that scholar is likely to mislead us in the interpretation of the passage. The Bhashya of Bhaskara Bhatta fully shews that Sayana is not here following any older tradition and the reasons given by him for explaining the position assigned to the Phalguni full-moon in the Vedic works are mere conjectures and guesses of his own. I admit that even the guesses of a scholar like Sâyana deserve consideration. But when on a closer examination we find that they are not supported by any old traditions and are besides objectionable on various other grounds, I think we are bound to reject them. As observed by Bhaskara Bhatta the passage in the Taittiriya Sanhitâ must, therefore, be understood as referring to an older year beginning, and we must hold that the full-moon in Phâlguna did as a matter of fact once commence the year at the winter solstice. I know that this view has been regarded as improbable by some scholars, on the sole ground that it would, if substantiated, enhance the antiquity of the Vedic works by about 2000 years more than what these scholars are willing to assign to them; and as the natural result of such prepossessions amongst them the subject has till now remained uninvestigated. But I hope that they will patiently examine the evidence, direct and corroborative, which I intend to put forth in support of the suggestion and then give their judgment upon it. There is no a priori impossibility involved in the hypothesis that the old priests, after changing their starting point to the Krittikas and framing the calendar accordingly, continued to recognize for sacrificial purposes, the older positions of the Nakshatras, just as all Brâhmans from the Himâlaya to the Cape Comorin at present

perform their sacrifices on days and at times fixed when the vernal equinox was in the Krittikas. I think the present Brahmans are worse off in this respect, inasmuch as they have not even the liberty, which the passage in the Taittiriya Sanhita accorded, though hesitatingly, to the old priests, of choosing either the old or the new calender. To use the words of Professor Max. Müller we must in such cases, therefore, "keep our preconceived notions of what people call primitive humanity in abeyance for a time," and form our judgment of antiquity, as we do of other facts, solely upon evidence.

We have seen in the last chapter that the evidence for placing the vernal equinox in the Krittikas consisted of (1) the lists of the Nakshatras all beginning with the Krittikas, (2) the winter solstice then falling in the month of Magha, (3) the Nakshatra at the summer solstice being presided over by the pitris, and (4) the possibility of considering, as Bentley suggested, the portion of the Nakshatra at the autumnal equinox as divided by the equinoctial colure. In short, if the year was supposed to have begun in the month of Magha, the position of the four cardinal points of the ecliptic as referred to the Nakshatras, was consistent with, and so indirectly established the truth of, such a supposition. Let us see if we can produce similar evidence for establishing the hypothesis (for it is no better at present) that the year in the old Vedic days began, as stated in the Brahmanas, with the Phâlguni full-moon, and that the winter solstice occurred on that day. On a rough calculation the vernal equinox, must recede two divisional Nakshatras to make the seasons fall back by one month. If the winter solstice, therefore, occurred in the month of Phalguna, one month

^{*} India: what it can teach us? p. 112,

equinox must then have been in Mrigashiras or two Nakshatras in advance of the Krittikas. Taking the data given in the Vedanga Jyotisha as his basis, the late Krishna Shastri Godbole has thus calculated the position of the four cardinal points of the ecliptic, when the winter solstice, as stated in the Brahmanas, occurred on the full-moon day in the month of Phalguna:—

- (1) The winter solstice in 3° 20' of the divisional Uttarâ Bhâdrapadâ;
- (2) The vernal equinox in the beginning of Ardra;
- (3) The summer solstice in 10° of Uttarâ Phalguni; and
- The autumnal equinox in the middle of Mûla; or giving up the system of reckoning by the divisional portions of the Zodiac, we have, roughly speaking, the winter solstice quite near the asterism of Uttara Bhadrapada, the vernal equinox between the head and the right shoulder of Orion or about 3° east of Mrigashiras, the summer solstice at a distance of within 2° east of Uttara Phalguni and the autumnal equinox about 5° east of the asterism of Mûla. If we suppose the vernal equinox to coincide with Mrigashiras, the three other cardinal points are brough nearer to the fixed asterisms, and this appears to be the more probable position of the equinoxes and the solstice in those days. But without entering into these details, i will be evident from this that when the winter solstice fell or the Phalguni full-moon the vernal equinox must be very near the asterism of Mrigashiras or two Nakshatras ii advance of the Krittikas. We have now to see what evidence there is in the Vedic works from which this old position o the four principal points in the ecliptic may be established.

^{*} See his essay on the Antiquity of the Vedas, p. 19.

There appears to be no express passage in the Vedic works, which states that Mrigashiras, like the Krittikas was ever the mouth of the Nakshatras. But what is so lost may still be discovered, in the words of Prof. Max Müller, "hidden in the secret drawers of language." Mrigashiras may not be specifically described as the first of the Nakshatras; but the word Agrahayanî which Amarsinha (i. 3. 23), gives as a synonym for Mrigashiras, and which supplies, according to Pânini, a derivative word for the month of Mârgashîrsha tells the same tale. Agrahâyanî literally means "commencing the year;" and the question is how did the Nakshatra come to be so called? In explaining the formation of this word all native lexicographers begin by assuming that the full-moon in the month of Margashirsha was the first night of the year, hence called Agrahayanî, and as this full-moon occurred in the month of Margashirsha the month itself was called Agrahayanika. There is no grammatical inconsistency so far. But when these lexicographers further tell us that the Nakshatra itself was called Agrahayani, as Amarsiuha has done, because the full-moon in the vicinity of that Nakshatra commenced the year in old days, one feels that there is something wrong in this explanation. The ordinary course is to name the full-moon or any other day after the Nakshatra, as Chaitrî, Paușham, Paușhî, &c (Pan. iv. 2, 3), while in the present case the order is reversed and the Nakshatra, we are told, is named after the full moon. It is true that the lexicographers were, to a certain extent,

^{*} See Bhânu Dikshita's commentary on Amar. i. 3, 23. He ex plains the word thus:—अग्रे हायनमस्या:। मार्गशिर्धमारम्य वर्षप्रवृत्ते:। प्रज्ञाद्यण्! पूर्णपदादिति णत्वम्। आग्रहायणी पौर्णमासी। तथागासक्षत्रमिप तथा।

compelled to adopt such a course, as they could not other wise explain why Agrahayani, a term usually denoting; full-moon night, should have been given as a synonym for the Nakshatra of Mrigashiras by Amarsinha. But what ever their motive, we have now to see if their explanations as well as the statement in Amara, are correct. Turning to Pânini we find no authority for this converse process The word Agrahayanî occurs in Panini iv. 2, 22, which lay: down the rule that the derivative names of months are formed from Agrahayanî and Ashvattha, by the addition of thak,* as a necessary termination; and this gives us the words Agrahayanika and Ashvatthika for the months of Margashîrsha and Ashvina. Now in the previous sûtre (iv. 2. 21) Panini states that the names of the months are derived from the names of the full-moon days that occur in those months. It appears, therefore, that he understood Agrahayani to mean the full-moon and not the Nakshatra of Mrigashiras. The word Agrahayanî occurs thrice ir Pânini (iv. 2. 22; 3. 50; and v. 4. 110) and in all place: it denotes the full moon day. It is not, however, clear whether Panini treated it as a word derived in the same manner as Chairi, &c. If we, however, rely on analogy there is every reason to hold that Agrahayanî, like Kârtik and Pháiguní, may have been derived from Agraháyana, and that this may originally be the name of the Nakshatra o Mrigashiras. This supposition derives support from the fact that if, like Amarsinha, we take Agrahayanî a

^{*} The satras of Pâṇini referred to in this discussion are नक्षत्रे।
युक्तः कालः (iv. 2. 3), सास्मिन्पोर्णमासीति संज्ञायाम् (iv. 2. 21), आप्र
हावण्यश्यादक् (iv. 2. 22.), विद्वीरादिस्यश्च (iv. 1. 41.) and प्रज्ञादिस्यः।
(v. 4. 38).

synonymous with the Nakshatra of Mrigashiras and follow the native grammarians in deriving this name of the Nakshatra from that of the full-moon, it is very difficult to account for the initial long vowel in Agrahayanî. All lexicographers derive the word from Agra and Hayana combined in a Bahuvrihi compound and afterwards adding the feminine termination; thus Agra + hayana+î. But the feminine termination cannot be added without a previous suffix (an) which also gives the initial long vowel, as t is not a general feminine suffix, but is only used in special cases. We cannot get this an by Panini iv., 2. 3, as Agrahayana is not the name of a Nakshatra according to Amarsinha. Various suggestions have, therefore, been made to account for the initial long vowel. Bhattoji suggests that we should obtain the long vowel by including Agrahâyana in the Prajnâdi list (Pan. v. 4. 38); but in the Ganapatha, the list is not said to be a 'specimen list'," nor is the word Agrahâyana specifically included in the list there given. Boehtlingk and Roth in their dictionary obtain the long vowel by Pan. v. 4. 36; but here 36 may probably be a misprint for 38. Târânâtha in his Vâchaspatya obtains the long vowel by Panini v. 2. 102, Vartika 1; but Jyotsnadi is not again expressly said to be a 'specimen list.' Bhānu Dikshita, the son of Bhattoji, in his commentary on Amarat adopts his father's view and refutes that of Mukuta. The latter obtains the initial long vowel from the very fact that the word itself is so pronounced by Panini in iv. 2. 22; but this gives us Agrahayanî as a ready made

^{*} आकृतिगण:, meaning that the list is not exhaustive.

[†] See p. 62 of the Bombay Ed. of Bhanu Dikshita's com. on Amara.

word at once, and Mukuta had to assign some reason why the word should have been again included in the Gauradi list in Pan. iv. 1. 41. Mukuța's explanation is that Panini thereby intends to show that the feminine termination in Agrahayanî is not dropped in compounds. But Bhanu Dikshita replies by observing that the Gauradi list was never intended for the purpose and that as regards the accent we can get it otherwise. Bhânu Dikshita's own explanation or that of his father Bhattoji also dispenses with the necessity of including the word in the Gaurâdi list as they obtain the feminine suffix i by Pan. iv. 1. 15; and so in replying to Mukuta he observes at the end that the "inclusion of the word in the Gaurâdi list is questionable." Thus if we suppose Amarsinha to be correct and accept either Bhattoji's or Mukuta's derivation of Agrahayani we shall have to hold that the word in question was either wrongly included or subsequently inserted in the Gauradi list and that Panini, who knew the word, forgot to insert it in the Prajnâdi or the Jyotsnâdi list. Both the explanations are again open to the objection that in this instance the Nakshatra is named after the full-moon as against the usual method given by Pânini in iv. 2. 3.

The whole of this difficulty, however, vanishes, if we give up the notion, that the full-moon night in the month of Mârgashîrsha might have commenced the year at one time and that the name of the Nakshatra as given by Amara must be derived from the name of the full-moon. There is no express authority in the Vedic works to support such a theory and a closer examination of Pâṇini's sûtras points to the same conclusion. Months in the Hindu calendar receive their names from the full-moon nights occuring in them; and the characteristics of a month are the same as

those of the full-moon night after which it is named. If the full-moon night in Margashirsha was, therefore, ever the new-year's night then the month itself would have come to be properly called the first month of the year. In other words the month of Mârgashîrsha would itself, in that case, be called Agrahayana. Boehtlingk and Roth do interpret the word Agrahayana in this way on the authority of Shabda-kalpa-druma and Târânâtha has done the same probably on the same authority, for none quotes any passage where the word is so used. Now if Agrahayna ever meant the month of Margashirsha the word would also assume the form Agrahayana on the ground given above by Bhattoji; and we shall have Agrahayana as another name of the month of Margashirsha. The word occurs in the Gauradi list (Pan. iv. 1.41), and therefore must be taken to have been known to Panini. What did he understand it to mean? There is strong ground to hold that he could not have understood it to mean the month of Margashirasha. For if we suppose that in Panini's times there were two forms of the word in this sense—Agrahayana and Agrahayanika—he would have rather mentioned Agrahayani in iv. 2. 23,† along with Chaitrî, &c., which gives the double form-Chaitra and Chaitrika and not with Ashvatta in iv. 2. 22+ as he has now done. We may, therefore, infer that Agrahavanika was the only sanctioned form of the word to denote the

^{*} Bhânu Dikshita, in his commentary on Amara i. 4. 84. gives Agrāhayana as a synonym for Mârgashîrsha on the authority of Durushottama and obtains the initial long vowel by including the word in the Jyotsnādi iist.

[†] The suiras are—आग्रहायण्यश्वरथाद्व (iv. 2. 22) विभाषा फाला-शिश्रवणकार्तिकीचेत्रीभ्यः (iv. 2. 23). As the suiras follow each other is natural to suppose that Agrandyanî, if it gave rise to two forms, hould have been included in the second suira.

month of Margashirsha in Panini's time. This means that Pânini did not know of the theory which makes the year commence with the Mârgashîrshî full-moon night or the month of Mârgashîrsha (Agrahâyana). If so, he could not have derived the word Agrahayani for the full-moon night directly by taking it to be a Bahuvrihi compound.* The only other alternative is to derive it as we derive Chaitri and other similar words, and I think this is what Panini meant. For if he had been aware of any such difficulty in the formation of Agrahayani,—a word thrice used by him,—and especially in in obtaining the initial long vowel as Bhattoji and others have felt by taking it to be a Bahuvrihi compound, he would have naturally noticed it himself. I therefore conclude that Panini derived Agrahayanî from Agrahayana, as the name of a Nakshatra. In this case we can derive Agrahavani in a simple and easy manner. For by Panini iv. 2.3, we get the initial long vowel, when derivative words are formed from the names of the Nakshatras to express time; we now want the feminine suffix i, and though this could have been obtained by Pan. iv. 1. 15, yet, for accentual purposes, it may be considered as provided for by the inclusion of the word Agrahavanat in the Gaurâdi list in Pan. iv. 1. 41. We can thus derive the word in the ordinary way, and unless we have strong grounds to maintain that it was really the full-moon night and not the Nakshatra, which commenced the year, we shall not be justified in accepting unusual derivations and explanations of these words. It is true that the word

^{*} For then the sull-moon night, and hence the month, would itself be the commencement of the year.

[†] Doubts have been raised as to the exact form of the word mentioned in the Gauradi list, and Bhanu Dikshita goes so far as to question whether the word was really included in the list by Panini.

Agrahâyana as denoting a Nakshatra is now lost and Amarasinha only gives Agrahavanî and not Agrahayana as a synonym for the Nakshatra of Mrigashiras. But I shall presently show that Amarasinha is not alone in misconceiving the meaning of these old words. The theory that the Margashîrshî full-moon was the first night of the year, has been the source of many other errors in later literature; but before examining these it was necessary to show how the theory has distorted the natural meaning and derivation of the very words on which it appears to have been based. As remarked above if there be any express or cogent authority to support the theory we might connive at the etymological difficulties, but if it be found that the theory is inconsistent with many other facts, or leads, as I shall presently show, to absurd results, the etymological distortions would afford us an additional ground for rejecting it.

We shall now examine in detail the theory that the full-moon night in Mârgashîrsha was once the first night of the year. So far as I am aware there is no express authority for such an hypothesis except the statement in the Bhagavad-Gîtâ (x. 35) where Krishna tells Arjuna that he, Krishna, is "Mârgashîrsha of the months (and), Vasanta of the seasons." Ânandagiri in his gloss on Shankara's Bhâshya upon the Gitâ, observes that Mârgashîrsha is here specially selected because it is a month of plenty. But the reason does not appear to be either sufficient or satisfactory; for the next sentence, and in fact the whole context, shows that Mârgashîrsha was here intended to be the first of the months. The principle commentators on the Gîtâ are too philosophical to notice this point, but in a commentary written by Sûrya Pandit, an astronomer, entitled the Paramârtha-prapâ, I find that he explains

the statement on the ground that Margashirsha was otherwis called Agrahayanika, and the latter word denotes that the ful moon night in this month was the first night of the year.*] we accept this explanation, and no other plausible one is forth coming, it appears that this statement in the Bhagavad-Gît was based on an etymological misconception of the meanin of the term Agrahavanika; and later writers like Amarasinh and Vägbhata, t simply followed the Gita in assigning th same position to the month of Mârgashîrsha. We may, there fore treat all these statements as coming from one source an representing a certain period of the Sanskrit literature, whe native scholars first misconceived the primary meaning c Agrahavanika. I have already shown that, properly under stood, the etymology of the word gives little room for sucl a misconception. Agrahivanika is really a derivative wor and cannot therefore mean that the month denoted by i was the first in the year just as Jyeshtha does not mean the eldest month. But it appears that the tradition abou Mrigashiras (Agrahiyana) ever being the first of the Naksha tras, was completely lost in those days, and native scholar

^{*} The commentary is printed at Poona. The words in the original are—यद्वा मृगशिर: पूणिमासंबंधन वर्षादिरभिहितस्तिस्मनेवाम हायणीत्याभिधानात्। आग्रहायणं यस्यां साग्रहायणी। अत एवाग्रहायणि इति मार्गशीर्पनाम । अतोऽस्य मासस्य मुख्यस्वाद्विभूतिमत्वम्। । Anandagiri's explanation be correct then the Gitâ is not opposed to deriviag Agrahiyani from Agrahiyana, the name of a Nakshatra, and the whole of the above discussion would be unnecessary.

t Vågbhata, in his larger work entitled Ashtångasangrahi otherwise called Vriddha Vågbhata, enumerates the months as biginning with Mårgashirsha. In i, 4 of the work the Uttaråyana said to commence with Mågha, while Mårgasbirsha is mentione first amongst the months there enumerated, much after the san way as Amara has done in i. 4, 13 and 14.

believed, on what they considered to be sound etymological grounds that the month and not the Nakshatra was the commencement of the year. Once started and embodied in the Gîtâ, the theory gained an easy and rapid currency amongst native scholars, all of whom naturally felt bound to shape their views accordingly.

And not only literary scholars, but astronomers appear to have done the same. In old astronomical works the year commenced with the winter solstice and the first month of the year meant the first month of the Uttaravana which commenced with this solstice. If then the Margashirshi full moon was said to be the first night of the year, an astronomer would naturally understand such statement to mean that the winter solstice fell on the full-moon day of Mârgashîrsha. Now if we suppose that the Margashirshi full-moon was thus the night of the winter solstice, it would mean that the full moon on that day happened to be near the asterism of Mrigashiras. With the sun at the winter solstice, the moon, to be full, must be near the summer solstice; and therefore the summer solstice must have then coincided with the asterism of Mrigashiras. The vernal equinox is 90° behind the summer solstice; and if Mrigashiras coincided with the latter, the vernal equinox would then be 90° behind the asterism of Mrigashiras. This is the only logical and mathematical conclusion possible if we accept the theory that the full-moon night in Mârgashîrsha was the first night of the year at the winter solstice. And what does it mean? It means a clear mathematical absurdity to us, though older astronomers, not realizing its full effect, invented an explanation to account for it. The Sûrya Siddhânta (viii. 2. 9) gives 63° as the polar longitude of Mrigashiras, counting from Revati. Now if the vernai

equinox was 90° behind the asterism of Mrigashiras, it was 90°-63° = 27° behind the asterism of Revati ! The Vedicworks, on the other hand, mention the Krittikas as the first of the Nakshatras, and the winter solstice is shewn to have then occurred in the month of Magha. This means that the vernal equinox must be placed at least 26° 40', or nearly 27° in front of Revati. Now imagine the position of the Indian astronomer, who could neither reject the statement in the Vedic works, nor the one in the Bhagvad Gita. Both were sacred and unquestionable texts, and it would be no wonder if, to his great relief, he got over the difficulty by proposing a libration of the equinoxes, 27° on either side of Revati! The hypothesis is now given up by modern astronomers as mathematically incorrect; but no reason has yet been assigned why it found place in the Hindu astronomy. A theory may be erroneons, but even an erroneous theory cannot become prevalent without a good cause. It has been suggested by Bentley and approved by Prof. Whitney t, that the limits of the libration might have been determined by the fact that the earliest recorded Hindu year had been made to begin when the sun entered the asterism of Krittikâ or 26° 40' in front of Revati. But this alone is not enough to suggest the theory of libration. For, unless the Hindu astronomer had grounds-to him conclusive and

This may imply that the Surya Siddhanta was in existence at the time when the libration theory was started. I think it was. But it has been suggested that the libration theory might have been subsequently inserted therein (see Whitney's Sur. Sid., p. 104., It is not, however, necessary to make any supposition regarding the existence of the Surya Siddhanta at this time, as almost all other Siddhantas give the same bhoga, viz., 63° for Mrigashiras. See Colebrooke's Ess ys, Vol 11., p. 325 (table).

[†] See Surya Siddhânta, p. 103.

otherwise inexplicable—for holding that the vernal equinox fell 27° on each side of Revati, he would not have proposed the libration of the equinoxes. So far as I know no such grounds have been yet discovered by modern scholars, and if the explanation given above accounts for the theory in all its details, I see no reason why it should not be accepted as a probable explanation. Perhaps, it may be asked, what grounds I have to suppose that the astronomers combined the two statements declaring that Magha and Margashirsha were both, each in its turn, the first months of the year, and so obtained the theory of the libration of the equinoxes. This is, however, not the place to go fully into this discussion; for all that I am bound to prove, as far as the present inquiry is concerned, is that if we accept the theory that the Margashîrsha full moon was ever the new-year's night, it leads us to an absurd conclusion, and this is evident from the above whether it does or does not give the real explanation of the libration theory. I may, however, remark that when we actually find Amarasinha first stating (i. 4. 13) that "seasons comprise two months each beginning with Mâgha, and three such seasons make au ayana," and then in the very next verse enumerating the months commencing with Mârgashîrsha; there is nothing extraordinary in the supposition that some Hindu astronomers might have similarly attempted to reconcile what were then regarded as the two beginnings of the year, by placing the statements in juxtaposition and pushing them to their logical conclusions. On the contrary, I should have been surprised if the Hindu astronomers had not done so.

But, apart from the origin of the libration theory, I think it is clear that, if we accept that the Mârgashîrsha full-moon was ever a new-year's night, in the sense that the winter

solstice occurred at that time, we are inevitably landed on an absurdity. By the ordinary proces of reductio ad absurdum, we are thus compelled to abandon the theory that the full moon in Mârgashîrṣha once began the year at the winter solstice. Native scholars and astronomers, who did not realize the absurdity, accepted the theory of the libration of the equinoxes as the only possible way of reconciling the two statements in their sacred books. We now know that the equinox cannot be placed 27° behind Revati, unless it be either in the beginning of the present cycle of the precession of the equinoxes or about 600 years hereafter, and we should have no difficulty in rejecting the premises that give us such a conclusion. Perhaps it may be urged that the full-moon night in Mârgashîrṣha might have been called the new-year's night in some other sense.* Yes, it

^{*} The only other explanation, I know of, is that given by Bentley in his Historical Survey of Hindu Astronomy, pp. 5-27. Bentley divides the zodiac into 27 lunar mansions, beginning with Shravishtha in the winter solstice, as in the Vedanga Jyotisha. Then he divides it again into 12 tropical months beginning with Magha. The beginning of Magha and the divisional Shravishtna thus coincide at this time. Now the beginning of each month must fall back owing to the precession of the equinoxes; and in thus receding if the beginning of any month coincided with any fixed lunar mansion, on the 6th lunarday, the month, says Bentley, was made to commence the year! But what authority is there in native astronomical works for such an elaborate and artificial theory to determine the commencement of the year? Native astronomers are surely expected to know better the theory on which they commenced their year. Then, according to Bentley's calculation, Ashvina was the first month in 1192 B. C. and Kartika in 945 B. C. But there is no evidence whatsoever in the Sanskrit literature to corroborate these results. Again why should either of these months not have been Agrahayanika? Bentley supposes that this method was in force till

might be; but what evidence is there that any native scholars ever thought of it? None that I know of. There are only two beginnings of the year known in ancient Hindu literature. I have shown that the winter solstice could not have occurred on the full-moon in Mârgashîrsha, and by the same method we can prove the improbability of the vernal equinox falling on that day. For if we suppose the Mârgashîrsha full-moon to be the new-year's night, in the sense that the vernal equinox occurred on that date, we must make the asterism of Abhijit coincide with the vernal equinox. This gives us about 20,000 years B. C. for the period when these positions could have been true. The author of the Bhagavata Purana appears to have had some such theory in his mind when he paraphrased (xi. 16. 27) the above quoted verse in the Gîta by "I am Mârgashîrsha of the months, Abhijit of the Nakshatras," and the late Krishna Shastri Godbole took this statement for a record of a real tradition! This illustrates the danger of relying on traditions in later books, without tracing them to their source in the oldest works we possess.

We must therefore rise above these etymological speculations of the native scholars of what Prof. Max Müller once called the Renaissance period of the Sanskrit literature. It is these speculations that have given us the libration theory

⁵³⁸ A. D.; if so, why should Pausha not become Agrahâyanika instead of Mârgashîrsha, in 451 B. C.? Bentley's unsupported speculation must, therefore, be rejected as imaginary. It gives no reason why Mârgashîrsha, the third of the several months which, according to his theory, would successively begin the year from 1193 B. C. to 538 A. D., should alone have been called Agrahâyanika and none whatever why the Nakshatra should be called Agrahâyani contrary to the usual rule, according to which the word should denote the full-moon day.

and interrupted the tradition of Agrahayana coming down to us intact. It is difficult to. say how these etymological speculations originated. Perhaps the word Agrahayanika was in course of time corrupted by nonuser into Agrahâyana on the analogy of Chaitra and Chaitrika, and such corruption gave rise to these speculations, or it might be that the year locally commenced with Margashirsha in certain provinces, and attempts were made to find an authority tor such custom in the etymological meaning of the word Agrahayanika. It appears to me more probable, however, that the old tradition about the Nakshatra gradually got connected with the month which was named after it as in the case of Kartika, whose first rank amongst months is suggested by Prof. Whitney "as due to the ancient position of the Krittikas as the first among the lunar mansions."* This is very likely if, as shown below, the word Agrahayani was ever used to denote both the Nakshatra and the full-moon. But whatever the origin, the speculation was there safe under the authority and prestige of the Bhagavad Gîtâ, and Amarasinha, who appears to have been not wholly free from the influence of such theories, naturally put down Agrahavani instead of Agraháyana, as the name of the Mrigashiras, especially as the latter word, Agrahayana, was not expressly mentioned by Pânini. Later lexicographers, who considered Amara and especially the Gita to be above error, attempted to reconcile Amara's statement with the system of Panini by unusual derivations, and astronomers appear to have vied with them in mathematically reconciling the real and the imaginary beginnings of the year! We must, therefore, set aside all these theories and go back to the purer times of Panini, to

^{*} See his Surya Sidbhanta, p. 271 (xiv. 16 n.)

determine what was the real name of the Nakshatra. I have already shown that Panini knew-the word Agrahavana and also that he could not have understood it to mean the month of Mârgashîrsha. It is, therefore, evident that he used it as a derivative from Agrahayana in the sense of time as given in Pânini iv. 2. 3. If so, he considered Agrahâyana to be a name of the Nakshatra of Mrigashiras. Amarsinha's Agrahayanî is, therefore, either an error or a feminine adjective or the tûrû of Mrigashiras meaning exactly the same thing as Agrahayana; thus Agrahayana = Agrahayana (Pan. v. 4. 38), Agrahayana + î (Pan. iv. 1. 15) = Agrahayanî. In supp rt of this derivation, may be cited the fact that Mrigashiras was once considered to be a feminine word. Mukuta and Bhânu Dikshita† both quote, Bopâlita who gives the neuter and the feminine forms of Mrigashiras. Râmanatha in his Trikânda Viveka, gives a quotation from Rabhasa and another from a Smriti to the same effect. If the word Mrigashiras was thus ever used in the feminine gender, the feminine adjective Agrahûvanî might have been used as a synonym for the same, not because it was the name of the full-moon, but because the asterism was spoken of in the feminine gender. This may account for the fact why Amarasinha lays particular stress on this point.

^{*} This is open to the objection that we have to include Apparahayana in the Prajnadi list.

f Amara i, 3, 23. Bhanu Dikshita's commentary is printed in Bombay and Mukuta's and Kshirasvamin's are published in Anundoram Borooah's unfortunately incomplete edition of Amera's lexicon.

[‡] See extracts from Râmanatha's com. in Anundoram Bonoch's publication, p. 112.

For says he "Mrigashirsham (is) Mrigashiras; Agrahayanî (is used) to denote the very same;" thus implying that a feminine word is used to denote what he supposed might be regarded only in the neuter gender. This is, indeed, a plausible explanation. It not only absolves Amarasinha from the charge of having given a wrong, or at least a distorted, word, but makes him warn his readers not to misunderstand the word Agrahayani for the full-moon night—a mistake into which almost all his commentators have, however, unfortunately fallen. It may further explain why instead of the Nakshatra, the full-moon day (both of which were on this theory denoted by the same word Agrhayanî) came to be regarded as the first night of the year and so gave rise to later speculations. But the fact that Amarasinha mentions Margashirsha first amongst the months shows that he was not altogether free from the influence of the speculative theory; and the explanation above stated must therefore be accepted with caution.

But whatever explanations we may adopt to defend Amara, I think it will be plain from the above that, so far as our purpose is concerned, we must reject the explanations of the commentators of Amara, who derive the name of the Nakshatra, as given by Amara, from Agrahayani, the name of the full moon. After this we may either suppose Agrahayana or Agrahayani, or Agrahayani to be the name of the Nakshatra, for in every case the difference consists only in the form and gender and not in the derivation, or the meaning of the word. Thus understood Agrahayani or Agraayana both give us the same meaning, viz., that the year was in the pront of the Nakshatra of Mrigashiras; or in other

[·] Thus:—मृगशीर्षं मृगशिरस्तिसन्नेवाप्रद्वायणी। Why तिसमन्नेव ?

words commenced with it. If what I have said above is enough to prove this, I do not care to insist on a particular form, whether masculine, feminine, or neuter, of Agrahâyana which as an adjective is the basis of all such forms. With this reservation, I may, I think, in what follows use the word Agrahâyana to dencte the Nakshatra of Mrigashiras and as evidencing the circumstance that it was so called because it was the first Nakshatra in the year.

Corresponding to the winter solstice in Phâlguna, we thus have the asterism of Mrigashiras or Agrahayana to commence the year from the vernal equinox, much after the same manner as the Krittikas were said to be the mouth of the Nakshatras when the winter solstice fell in the month of Mâgha. The express statement in the Brâhmanas that the Phâlgunî full-moon commenced the year from, as I have previously shown, the winter solstice, is thus borne out by the tradition which we find treasured up in Agrahâyanî. Now if the vernal equinox was near the asterism of Mrigashiras the autumnal equinox would be in Mûla. It has been ingeniously suggested by Bentley that this name signifying "root or origin" may have been given to the Nakshatra because it was once the first amongst the asterisms and he has actually given a list of the Nakshatras beginning with Mûla; but he does not appear to have used it except to show that when one of the twenty-eight Nakshatras was dropped the divisional Jyeshthâ and Mûla both began from the same fixed point in the heavens,—a position which gives him the vernal equinox in the beginning of the Zodiacal portion of the Krittikas. I have already shown that we cannot suppose that the old Vedic priests made observations of imaginary lines in the heavens, and Bentley's explanation which entirely depends

on the mathematical divisions of the Zodiac is not therefore satisfactory. Nor can I accept Prof. Whitney's suggestion that Mûla "may perhaps have been so named from its being considerably the lowest or farthest to the southward of the whole series of asterisms and hence capable of being looked upon as the root of all the asterisms." I should rather suggest that Mûla was so called because its acronycal rising marked the commencement of the year at the time when the vernal equinox was near Mrigashiras and the winter solstice fell on the Phâgunî full-moon. Agrahîyana setting with the sun in the west and Mûla rising in the east then marked the beginning of the year, and this position of Mûla is likely to be especially noted as the heliacal rising and setting of a star, and so of Agrahayana, is difficult to be accurately watched. The etymological meaning of Mûla may thus be said to supply a sort of corroborative evidence for placing the vernal equinox in Mrigashiras though, in absence of other strong grounds, it is of no better value than a similar conjecture of Bentley about the name Vishakha, noticed in the last chapter.

I have already mentioned before that the year was divided into two ayanas, the northern and the southern, and that though originally the northern ayana indicated the passage of the sun to the north of the equator yet it afterwards came to indicate the passage of the sun from the winter to the summer solstice. I have also stated that after this change was made all the attributes of the older ayanas must have been gradually transferred to the new ones, though the old division was concurrently kept up; and that the new ideas were formed solely with reference to the sol-

[·] See his Surya Siddhanta, p. 194.

stitial division of the year. Thus the Pitriyana during which time the sun in older times went down the equator must have come to be regarded, for some purposes at least, as commencing from the summer solstice. With the winter solstice occurring on the Phâlguni full-moon day, we shall have the summer solstice on the Bhâdrapadî full-moon, so that the dark half of Bhadrapada was the first fortnight in the Pitriyana, understood as commencing on the summer solstice. It was thus pre-eminently the fortnight of the pitris or the manes; and to this day, every Hindu celebrates the feast to the manes in this fortnight. As far as I know no reason has yet been advanced why the dark half of Bhâdrapada should be called the fortnight of the pitris (pitri baksha) and why special feasts to the manes should be ordained at this particular period of the year. With the winter solstice in the asterism of Uttarâ Bhadrapadâ, that is when it occurred on the Phâlgunî full-moon, the matter is simply and satisfactorily explained. For then the Dakshinayana or summer solstice commenced on the dark half of Bhadrapada and this fortnight therefore naturally became the first fortnight in the ayana of 'he manes."

And not only the Hindus but the Parsis celebrate their east to the manes at the same time. The coincidence is

^{*}This explanation implies that the feast to the manes became pernanently fixed at this time; and there is nothing improbable in it. for as the Parsis hold similar feasts on corresponding days we must uppose that these feasts became fixed long before the Parsis and he Indians separated. When the vernal equinox receded to the infatrapada. But though the priests could not alter the days of nese feasts, yet in assigning deities to the Nakshatras they recogised the change by making nitric procide.

important inasmuch as we are here dealing with periods of antiquity when the Indian, the Iranian, and Hellenic Aryas must have lived together, and if our theory is correct it is sure to be correborated by the customs, practices, and traditions of the other two sections of the Aryan race. I shall in the next two chapters show that there is ample independent evidence of this kind confirmatory of the theory that Mrigashiras commenced the equinoctial year in those early days. At present I shall only refer to the conclusions of Dr. Geiger as to the nature of what he calls the primitive or the oldest Avesta calendar. He takes madhyaryo-which literally means not 'mid-winter,' but 'mid-year'-as his basis and concludes that in the primitive Avesta calendar the year commenced with the summer solstice.* This is just what we should expect. The Indian Aryans commenced their year from the winter solstice or the beginning of the Uttarâyana and the Iranians, who in such matters always took a diamatrically opposite view. naturally commenced it with the summer solstice the beginning of the Dakshinayana, thus bringing the Bruma (or the winter solstice) in the middle of the year. But the coincidence does not stop here; and in the light of the old Indian calendar we are in a position to explain some difficult points in the primitive Avesta calendar. The Hindu pitri-paksha or the fortnight of the manes commenced with the summer solstice, while the Iranians celebrated their feasts to the manes just at the same time. The first month in their calendar was called Fravashinam or the month of the manes, and, according to the primitive calendar determined by

^{*} See Dr. Geiger's Civilization of the Eastern Iranians in Ancient Times, translated by Darab Dastur Pheshtotan Sanjana, Vol. 1., p. 153.

Dr. Geiger, this first month, whem the feasts to the manes were celebrated, * began with the summer solstice. Again the fourth month of the Avesta calendar was Tishtryehe or the month of Tistrya, which has been identified with the star Sirius. Counting with Bhâdrapada in the summer solstice, the fourth month in the Hindu calendar would be Mârgashîrsha or the month of Mrigashiras, which Nakshatra is quite near Sırius. We can now also easily explain why Dathusho should have been dedicated to the Creator. Beginning with Fravashinam in the summer solstice, Dathusho begins exactly at the vernal equinox, and as marking the revival of nature it was properly dedicated to the Creator. Roth again was partially correct when he imagined that Dathusho must have once commenced the year inasmuch as it was dedicated to the Creator Ahuramazda. For from the old Hindu calendar we see that the vernal equinox was also a beginning of the year. In the primitive Avesta calendar we can thus discover the traces of the year, beginning with the vernal equinox and also from the summer solstice (in opposition to the Hindu winter solstice) in Bhâdrapada, the month of the manes. These coincidences, especially about the month of the manes, cannot be said to be merely accidental. The worshippers of Ahuramazda

^{*}The last five days of the old year and the first five days of the new year are called "Fravardig an" days. "During these ten days the frohars (fravashi or fravarti) the spiritual representatives of the deceased are believed to come to the houses" of men on the earth. See Dr. Haug's Essays on the Parsis, p. 225 note. At present the Hindu feasts extend over the whole of the fortnight. We, however, find an alternative period recorded in the Nirnaya Sindhu, which states that the feasts may extend over a fortnight, ten days or five days!

changed the commencement of the year from the winter to the summer solstice, but as observed by Roth "a sacred and solemn feast could not be removed from its place in the year," * and this affords therefore a comparatively reliable ground to identify the Avesta and the Vedic year. We find nothing in the Avesta to explain why the first month of the year should have been devoted to the manes; but, as observed by Dr. Geiger in respect of the legend of Yama, the knowledge of it might in course of time have been lost to the worshippers of Ahuramazda. We can, however, now easily explain it from the statement in the Vedic works that Pnâlguni full-moon was once the new year's night at the winter solstice. I know that such analogies taken singly are of no great practical value, but when from a consideration of the Vedic literature, we arrive at results, which we then find so similar to those arrived at independently by Z and scholars, we may certainly be led to believe that they are not merely accidental.

To sum up: Interpreting the passage in the Taittiriya

^{*} See Dr. Geiger's Civ. An. Iran., Vol. I., p. 145. The annual feasts to the manes amongst the Parsis came after the Gahandars and it is interesting to note that the pitri paksha is defined in the Surya Sidhânta, xiv. 3-6, as the period of 16 days after the four Shadashitit-mukhas or festivals at intervals of 86 days each teginning with Libra. The author of the Surya Sidhânta is here evidently describing some old festivals and as Râshis were in use in his days he fixes the duration of these festivals according to the calendar then in force. The mention of Libra does not therefore prevent us from r garding Shadashiti mukhas as old festivals. But whether Shadashiti mukhas were in any way connected with the Gahandars it is not easy to determine in the present state of our wledge of these festivals.

month of the year," in the natural way suggested by the context and similar other passages in no less than five Brâhmanas, to mean that the winter solstice occurred on the Phalguni full-moon in those days, we find that Mrigashiras has been designated by a name, which, if properly understood, denotes that it was the first of the cycle of the Nakshatras, thus showing that the vernal equinox was once near it; that Mûla can now be better understood as the star that rose at the beginning of the first night of the equinoctial year; and finally the fortnight after the summer solstice was devoted to the feast of the manes, as the ayana of the pitris commenced at that point; and that this is fully corroborated by the Parsi month of the manes falling in their primitive calendar at the same time. It was on evidence like this that the old position of the Krittikas was determined, and I do not see why a similar conclusion about Mrigashiras should not be allowed. It is true that no express statement has been cited to show that Mrigashiras commenced the cycle of the Nakshatras in those days and that some scholars may not consider the Agrahayani sufficient for the purpose. In the following chapters I hope to show that there are a number of other circumstances-and even express texts--which leave little room for cautious fears like these.

CHAPTER V.

THE ANTELOPE'S HEAD.

Mrigashiras—Its oldest form and position—Identification of Rohin? and Rudra, etc.—Plutarch on the non-Egyptian origin of Orion, Canis and Ursa-Methods of interpreting mythological legends -Storm and dawn theories-Thelr insufficiency-Knowledge of the heavens amongst the ancient Aryas—Heaven and Hell, Devayana and Pitriyana-Joined by equinoxes, the gates of Heaven-Dogs at these gates-Kerberos and Yama's dogs-The Chinvat bridge and the dogs that guard it—Their identification with Canis Major and Canis Minor, when the vernal equinox was in Orion—Celestial river and Charon's boat— Comparison of the Rigveda and the Avesta dogs-Saramâ and Shunasîrau—Dog (star) commencing the year—Heliacal and acronycal rising of Orion in spring and autumn-Vishnu and Rudra—Kerberos and Orthros—The legend of Namuchi alias Vritra—His decapitation by Indra at the gates of heaven, where Orthros is stationed—Represented by the "antelope's head" in the heavens, Vritra being = Mriga-Compact between Indra and Namuchi-Watery foam-Its identification, with the Milky Way-Legends of Rudra-How he killed Prajapati Yajna or Sacrifice at the begining of the year-Shulagava sacrifice—Tistrya = tristri, the three star belt of Orion -The Hindu Trinity, Dattarreya-His representation in the sky.

The part of the heavens, which contains the Nakshatras, we have now to consider, is the most attractive and interesting in the celestial sphere. Even a casual observer on a clear night is sure to be attracted by its splendid appearance, and the rising of the sun in this portion of the heavens at the beginning the year must have rendered it doubly attractive to the ancient Aryan observers. It contains no less than five stars of the first magnitude including Sirius and a number of the second, with the stream of the Milky Way passing through them. Here there was a fine field for the virgin imagination of the ancient poets and

priests and the numerous legends that exist in almost all the sections of the Aryan race about this portion of the heavens fully show that they did not fail to make use of this brilliant opportunity. I intend to examine some of these legends in this chapter with a view to see what corroborative evidence we may get therefrom. If we can more naturally and easily explain the legends that relate to this part of the heavens on the present theory, than has hitherto been done, we may fairly conclude that we have rightly interpreted the passages from the Brâhmaṇas; if not, we shall have either to revise our assumption or to give it up entirely. But before we do so we must, as far as possible, try to identify the asterisms and determine their forms as described in the ancient works.

We shall first take up Mrigashiras or Âgrahâyanî according to Amarasinha. The very name of the Nakshatra, which means "an antelope's head," * suggests the figure of the asterism But the constellation consists of so many stars that it is very difficult to say which of them might have suggested the name. I may here remark that the doctrine of "Yogatârâs" or the junction stars cannot be supposed to have been developed in the early days we are here

I may here, once for all remark that though I have translated the word Mrigashiras by the "antelope's head," I do not mean to imply that Mriga necessarily meant "an antelope" in the Vedic literature. It has been suggested that Mriga may mean "a bullock" or some other animal like it. It may, but we have nothing to do with it, inasmuch as the word Mriga itself is still used in the Sanskrit literature to denote the constellation. My translation of Mrigashirás must therefore be considered provisional, remembering that though it may change yet the argument in this chapter will still remain unaltered.

speaking of. I do not mean to say that single stars may not have been or were not specifically named. But whereever a constellation is spoken of, it is more probable that the whole group was intended, as in the case of the Seven Bears or the Krittikas; and hence the determination of the junction stars, as given in later astronomical works, cannot help us beyond indicating where we are to look for the constellation described in the old works. For instance, if we take Mrigashiras we are told that one of the three small stars in the head of Orion is the junction star. This means that we must look for Mrigashiras in the constellation of Orion. But how can these three stars give us the figure of an antelope's head? The three stars are so close that between them. selves they give us no figure at all. It is, however, suggested that the two stars in the shoulders and two in the knees of Orion give us the four feet of the antelope, whose head may then be said to correspond with the three stars in the Orion's head. In short it is the antelope's head in the same way as it is the head of Orion. But besides being open to the objection that this gives us the head and not the form of an antelope's head, the explanation presupposes that the whole of the antelope is in the heavens; and if Ardra be correctly identified with the star in the right shoulder of Orion we shall have also to include this star in the four feet of the antelope. The old Vedic works, however, seem to lay down that it was the head of the antelope and not the antelope itself, that was transplanted to the heavens. Referring to the legend of Rudra piercing Prajapati, Sâyana in his commentary on the Shatapatha Brâhmana (ii. 1. 2. 8) * observes that he, the

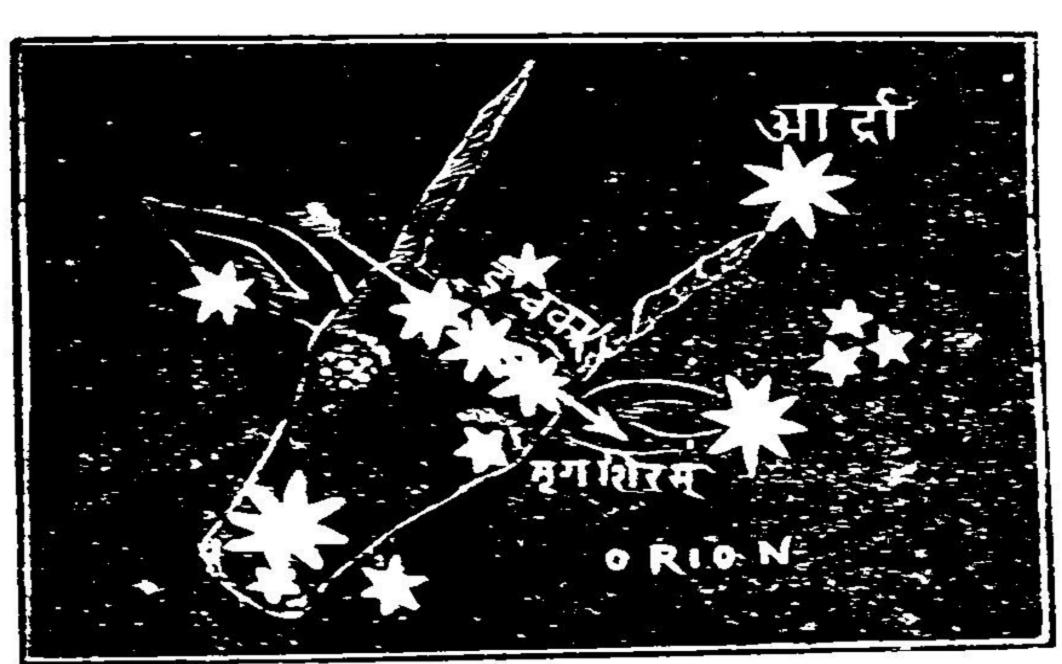

^{*}इषुणा तस्य शिरश्चिरछेद ' इषु: शिरश्चेत्युभयमंति क्षिमु व्युत्य नक्षत्रात्मना-वश्चितं दृश्यते । Sayana's commentary on Shat, Br. ii. 1. 2. S.

terrible form created by the gods, "cut off Prajapati's head by the arrow," and "the arrow and the head both jumped up to the heavens and are there stationed." The Aitareya Brâhmana (iii. 33) gives the same story and there too Pashuman or Bhûtavan is said to have pierced Prajâpati with an arrow. But it does not distinctly say whether it was the head or the body that was pierced by him though in the Shatapatha Brahmana Mrigashiras is described as the head of Prajapati. The tradition of piercing the head does not, however, occur in this form in the Rigveda, though in Rig. x. 61. 5-7 this story of Prajapati is alluded to. But in many places where Indra is mentioned as killing Vritra we are told that he cut off the head of his enemy (i. 52. 10; iv. : 8. 9; viii. 6. 7) and in Rig. v. 34. 2 and viii. 93. 14, Indra's enemy is described as appearing in the form of an antelope. This shows that the Rigveda indirectly speaks of an antelope's head having been cut off by Indra, and it may justify us in holding that Rudra did the same. The tradition is preserved even in the Greek mythology which tells us that Apollo, indignant at her sister's affections for Orion, made her hit, with an arrow, a mark in the distant sea, which turned out to be the Orion's head.* In the heavens we must therefore look for the "cut off" head of Mriga with the arrow pierced in it. There are other circumstances which point to the conclusion. Sanskrit writers have described a small group of stars in Mrigashiras called Invakas. Amarasinha tells us that they are "on the top of Mrigashiras. + Now if Mrigashiras

^{*} See Smith's Dictionary of Classical Mythology. Ov. Fast, v. 537.

[ं] Thus:—मृगशीर्षं मृगशिरस्त!स्मन्नेवाग्रहायणी । इन्वकास्ताच्छरोदेशे तारका निवसंति याः । Amara i. 3. 23. तच्छरोदेशे=मृगशीर्षशिरोदेशे according to Bhân ıDikshita.

itself be understood to denote the three small stars in the head of Orion, Invakas become identical with them and the distinction given in Amara must be put aside as meaningless. I am, therefore, of opinion that the asterism of Mrigashiras was once really believed to possess the form of an antelope's head with an arrow sticking to it. The mention of the arrow in these traditions at once enables us to determine the form, for the arrow can be readily and easily identified with the three stars in the belt of Orion. The head with the arrow at the top must therefore be made up by taking along with the belt the two stars in the knees and one in the left shoulder of Orion somewhat as below:—

It gives us the arrow pierced into the head and the three stars in the belt are at the top of the antelope's head—a position which Amara assigns to Invakis. I may further observe that the ancient observers could not and would not have selected the three small stars in the Orion's head to form their asterism when there were so many stars of the first and second magnitude in the same portion of the heavens. Then again whatever the later astronomers may say about the junction stars in Mrigashiras, the three stars

of that asterism popularly pointed out, even at present, are those in the belt and not in the head of Orion. I do not mean to imply that the asterism may not have been conceived and figured otherwise. As a matter of fact we know that it was figured as a hunter or a deer, and there are good grounds to hold that these are ancient ideas. All that I, therefore, mean is that of the various figures we may make out of the stars in the constellation of Orion, one should be of an antelope's head with the arrow sticking to it to represent the cut off head of Mriga, and not as the present configuration supposes both the body and the head of Mriga together and unseparated.

I have in what has gone above presumed that the asterism of Mṛigashiras must be looked for in the constellation of Orion, and that the legends of Rudra and Prajāpati refer to this constellation. Some scholars, however, doubt the correctness of this assumption; and so far as absolute certainty is concerned their doubts may be justifiable. For, Vedic hymns were not committed to paper till a long time after they were sung, and there is of course no possibility of finding therein a photograph of the portion of the heavens referred to in the various hymns. All that we can, therefore, do is to weigh the probabilities of the proposed identifications; and if this course be adopted I do not think any reasonable doubts could be entertained about the identification of Mṛigashiras with the constellation of Orion. To quote the words of Prof.

^{*}The constellation appears to have been variously conceived:—
(1) the antelope's head; (2) the whole antelope; (3) Prajapati either in the form of an antelope or as a person with a belt or Yajnopavita (see the next chap.). Of these three forms I consider the "antelope's head" to be the oldest. It will be seen that the three forms are closely connected, and thad they are the developments of the same idea.

Whitney "there is the whole story illustrated in the sky: the innocent and the lovely Rohini (Aldebaran); the infamous Prajapati (Orion) in full career after her, but laid sprawling by the three-jointed arrow (the belt of Orion), which shot from the hand of the near avenger (Sirius) is even now to be seen sticking in his body. With this tale coming down to us from the first period of Nakshatras in India who could have the least doubt of its persistent identity from the earliest times to the latest?" I subscribe to every word of what is here so forcibly expressed. Of course, we may expect some variations of details as the story got degenerated into Puranic legends; but it is impossible to mistake the general identity. I shall therefore not unnecessarily dwell upon it here.

We have seen how Mrigashiras may have been primitively conceived. After this it is not difficult to identify the other stars. The Rohini is no other than Aldebaran. Rudra is the presiding deity of Ardra, and we may therefore suppose Rudra to be represented by the star in the right shoulder of Orion (a). But the Aitareya Brahmana (iii. 33) identisies Rudra with Sirius or what is now called the Mriga-vyadha. The Milky way does not appear to have received a specific name in these old days, and the three sections of the Aryan race—the Parsis, the Greeks, and the Indians—have no common word to denote the same. Yet it is impossible to suppose that this broad stream of stars could have been unnoticed, and I shall show further on that it was Greeek astronomy places two dogs in this part of the heavens-Canis Major and Canis Minor-one on each side of the Milky Way, and it has been doubted whether

^{*} See Prof. Whitney's Essays on Hindu and Chinese systems of asterisms, p. 53.

the claims of these dogs to primitive antiquity are well founded. In what follows, I hope to show that they are. In the meanwhile, I may here refer to the testimony of Plutarch to prove that some, at least, of the actually existing figures of constellations in the heavens are Greek transformations of others which had been placed there before by the Egyptians; for this writer, who in his treatise De Iside et Osiride makes the priests of Egypt say that the souls of gods shine in the heavens and are stars, adds that "the constellation of Isis is called, by the Greeks, Canis; that of Horns, Orion, and that of Typhon, Ursa." This statement is very important, inasmuch as it shows that the names of at least three constellations, Orion, Canis and Ursa, are not of Egyptian or Chaldean origin. Of these Ursa Major (Greek Arktos) has been already identified with sapta rikshas or simply the rikshas of the Vedas and the Haptôiringa of the Parsis, thus partly confirming the above-mentioned statement of Plutarch; and it can be shewn, that his observation is equally good in respect of the other two constellations, or that Canis, Orion and Ursa are all of Aryan origin. At present I use Plutarch's statement only so far as to justify us in presuming the three constellations to be of Aryan origin, or, to put it negatively, not borrowed by the Greeks from the Egyptians. †

De Iside et Osiride. I take the quotation from Narrien's Origin and Progress of Astronomy, p. 44. Narrien further observes that this assertion of Plutarch seems to be confirmed by the discovery of a sculptured planisphere on the ceiling of the Temple of Denderah where "in the place of Canis Major is traced a cow, the animal consecrated to Isis" and "instead of Orion is the figure of man which is supposed to be intended for the son of Osiris."

I have deemed it necessary to make these remarks because Mr. Gladstone in his Time and Place of Homer, p. 214, observes that Orion is either "non Hellenic or pre-Hellenic." Plutarch's

Having thus shown that we are at liberty to assume that the Greek legends about Orion and Canis are not of foreign origin, let us see what coincidences we can discover between the legends of the three sections of the Aryan race about this part of the heavens. I am not going to trace every legend to its primitive source and explain it on the dawn or the storm theory. Nor do I believe that it is possible to do so; for there are many other objects in nature besides the dawn and the storm, that are likely to impress the mind of a primitive man; and a legend, though it might have originated with the sun or the dawn, is sure to grow and develop under the influence of these objects. For instance, we can understand the story of Vritra by supposing that he represented the power that locked up the waters in the clouds, but when we are told that this Vritra sometimes assumed the form of a Mriga, here is a distinct addition which cannot be satisfactorily accounted for on the original theory. Those that have watched and examined how legende grow can easily understand what I mean. The idea that everything must be reduced to "dawn and nothing but the dawn" is the result of supposing that in the days of the Rigveda men were not acquainted with anything else. The supposition is partly true, but as I shall presently show there are many passages in the Rigveda which presuppose the knowledge of stars and constellations. Thus

Egyptian origin. The conception must therefore be pre Hellenic, or, in others words. Indo Garmanic, and I think I have given ample evidence in this chapter and the next to prove that the idea of Orion was fully developed before the Greeks, the Parsis and the Hindus separated.

[·] See He bert Spender's Sociology, Vol. 1., Chap. xxiv.

at the time we are speaking of several ideas had already been formed and recognised and even familiarly known. For example, the idea of Devayana and Pitriyana appears to have been well settled at this time, so much so that though the year was afterwards made to commence with the winter solstice, the equinoctial division of the heavens, with all the notions which had already become associated with it, continued to exist, though somewhat restricted in its scope, side by side with the new system. Whether this idea itself is or is not further resolvable into simpler ideas is a different question altogether. Perhaps it may be shown to have grown out of the idea of day and night or light and darkness. There are several passages in the Rigveda (i. 123. 7; 164. 47.) which speak of a black and a white day, and it is very likely that these were the original names of Devayûna and Pitriyana; for when new ideas are introduced it is usual to express them in old words with such qualifying adjectives as would distinguish the new idea from the old one. A "black day" might thus mean the Dakshinayana or the Pitriyana, as night appeared to increase at the expense of day during the period. When the southern course of the sun thus came to be likened to a dark day or night (Rig. vi. 9. 1) it was naturally regarded as a night of the Devas to distinguish it from the ordinary night; and as no sacrifices were performed during the ordinary night, so no offerings could be made to the Devas during their night (vi. 58. 1). Of course, it must have been a long time before men could develop conceptions like these. There was, indeed, a time when they could hardly account for the fact how the sun found his way from the west back to the east. In the Rigveda x. 72. 7, the sin is said to rise from out of the ocean and

a similar idea is found in Homer who describes not only the sun, but even the stars, as "bathed in the waters of the ocean." * In the Rigveda x. 108. 1, Saramà is said to have crossed really a "long way." The Aitareya Brâhmana iii. 44, which states that the sun never sets in reality, makes a distinct advance upon these notions. But it is difficult to say whether astronomical ideas were developed to such an extent in the days when the year first commenced from the winter solstice. I do not, however, wish to enter here into these details. As previously observed I assume that, at the time we are speaking, the Vedic Aryas had already passed through these stages, and that the ideas of Devayana and Pitriyana were familiarly known and established; and assuming these as established, I intend to examine how legends were built upon them. I have, however, briefly alluded to the probable origin of these ideas inasmuch as it helps us to better appreciate the description of the Devayana and the Pitriyana. Ordinarily the Pitriyana is described (Rig. ix. 113. 8) as the region "where Vaivasvata is the king, which is the undermost (lit. obstructed t) part of the heavens, and where there are eternal waters." The Vaivasvata Yama here spoken of does not, however, appear to have as yet been invested with the terrible character we find given to him in the later literature. Corresponding to Yama in the south we have Indra in the north, each supreme in his own sphere,

Lewis, Hist. Survey of the Astr. of the Ancients, p. 6. Iliad, v. 6, vii. 422.

[†]यत्रावरोधनं दिव: in the original. 1 think अवरोधन means "when the view or the heavens is obstructed;" "the portion of the heavens which is turned away," Cf. Ait. Br. iv. 14, where अवरोधन of the year is spoken of.

and dividing the whole world into two parts, one bright and known, and the other watery and mysterious, or, in the language of seasons, first comprising Vasanta, Grishma and Varsha and the second Sharada, Hemanta and Shishira.

Now when the vernal equinox was in Orion or Mrigashiras it was the beginning of the Devayana, and as the constellation is remarkable for its brilliancy and attractiveness the ancient Aryans may have been naturally influenced not merely to connect their old traditions with it, but also to develope them on the same lines. Thus the Devayana and the Pitriyana, as representing the two hemispheres must be joined, and the vernal and the autumnal equinoxes became the natural points of union between the regions of gods and Yama. The equinoxes were, in fact, the gates of heaven, and as such it was natural to suppose that they were watched by dogs. In the Rigveda i. 48. 15 the dawn is spoken of as illuminating the "gates of heaven," and in i. 13. 6 and ii. 3. 5 the gates-deties are invoked to keep the gates open. We have a similar invocation in the Vajasaneyi Sanhita 21. 49. This shows that the idea of the "gates of heaven" was not unknown in Vedic times and the arrangement of the gates on the sacrificial ground, which is prepared on the model of the annual passage of the sun, shows that these gates divided the whole hemisphere into two parts. Macrobius records a tradition that "the ancients designated the signs of Cancer and Capricorn as the gates of the sun, at which having arrived, the luminary seemed to retrace his path in the zone which he never leaves." * Now Macrobius could not but speak in the language of the twelve zodiacal portions, and if we therefore divest his statement of the form in which it is naturally

^{*} Macrob. Comment. in Somn. Scrip. Lib. I. cap 15. I take the quotation from Narrien's Origin and Progress of Astronomy, p. 51.

expressed it means that the equinoxes, which the ancients supposed to be once in the zodiacal signs named above, were then called gates of heaven.

The Iranians, however, have preserved the legend more fully. With them the equinox is not merely a gate, but a bridge connecting heaven and hell—the Devaloka and the Yamaloka, or the Devayana and the Pitriyana-and "dogs that keep the Chinvat Bridge" help the departing soul to cross it. Darmesteter, in his introduction to the Vendidad, published in the Sacred Books of the East Series, observes * that "this reminds one at once of the three-headed Kerberos, watching at the doors of hell and still more of the four-eyed dogs of Yama, who guard the ways to the realm of death" (Rig. x. 14.10). The ideas are, indeed, strikingly similar and point out to a common source. Kerberos has even been identified with Sanskrit Shabala or Sharvara, meaning variegated or a dog of Yama. But, as far as I know, no satisfactory explanation has yet been given of these legends nor any attempt made to explain them on a rational basis.† If we, however, suppose that the vernal equinox was once in Orion, the constellations of Canis Major and Canis Minorthe two dogs—would then be on the boundary line of heaven and Yama's region, and the whole of the above story may be seen illustrated in the sky like that of Prajapati and Rudra previously referred to.1 According to Bundahis

^{*} Sacred books of the East, Vol. IV., Zend-Avesta, Part 1., introduction v., 4.

[†] See Kaegi's Rigveda, by Arrowsmith, p. 160, note 274a, where the writer quotes Aufrecht to the same effect.

Weber and Zimmer appear to have suggested that the conception of Yama's dogs might have been formed from some constellations. Bloomfield rejects this suggestion and tries to show

xii. 7, the Chinvat Bridge extends from the height of Chakad-i-Daitak in the middle of the world to the summit of Arezur at the gate of hell; while Dr. Geiger cbserves that "it was believed to have been built over a wide expanse of water which separates the paradise from this world."* In the later Indian literature we are told that the souls of the deceased have to cross a stream † before they reach the region of Yama, while the story of Charon shews that even the Greeks entertained a similar belief. What could this river be? With the vernal equinox in Orion, one can easily identify it with the Milky Way, which could then have been appropriately described as separating the regions of gods and Yama, the Devayana and the Pitriyana, or the Northern and the Southern hemisphere. In the later Hindu works it is actually called the Celestial River (svarnadi), while the Greeks have placed

that the dogs represent the sun and the moon. His explanation does not, however, show how and why the dogs came to be located at the gates of heaven and why they should be entrusted amongst all the sections of the Aryan race with the duty of watching the souls of the dead. Bloomsield quotes Kath. S. xxxvii. 14 (where day and night are called the dogs of Yama) and Shat. Br. xi. 1. 5. 1. (where the moon is said to be a divine dog) to prove that the dogs must be understood to mean the sun and the moon. But I think that the Brahmana here gives simply a conjectural explanation, and, as in the case of Namuchi's legend, we cannot accept it, inasmuch as it dues not give any reason why the dogs were station. ed at the doors of Yama's region. There are many other incidents in the story which are not explained on Bloomfield's theory. I see, therefore, no reason for modifying my views which were put down in writing before I could get Bloomfield's paper in the last number of the Journal of the American Oriental Society.

^{*} Dr. Geiger's Civil. of East Iran., Vol. I., p. 100.

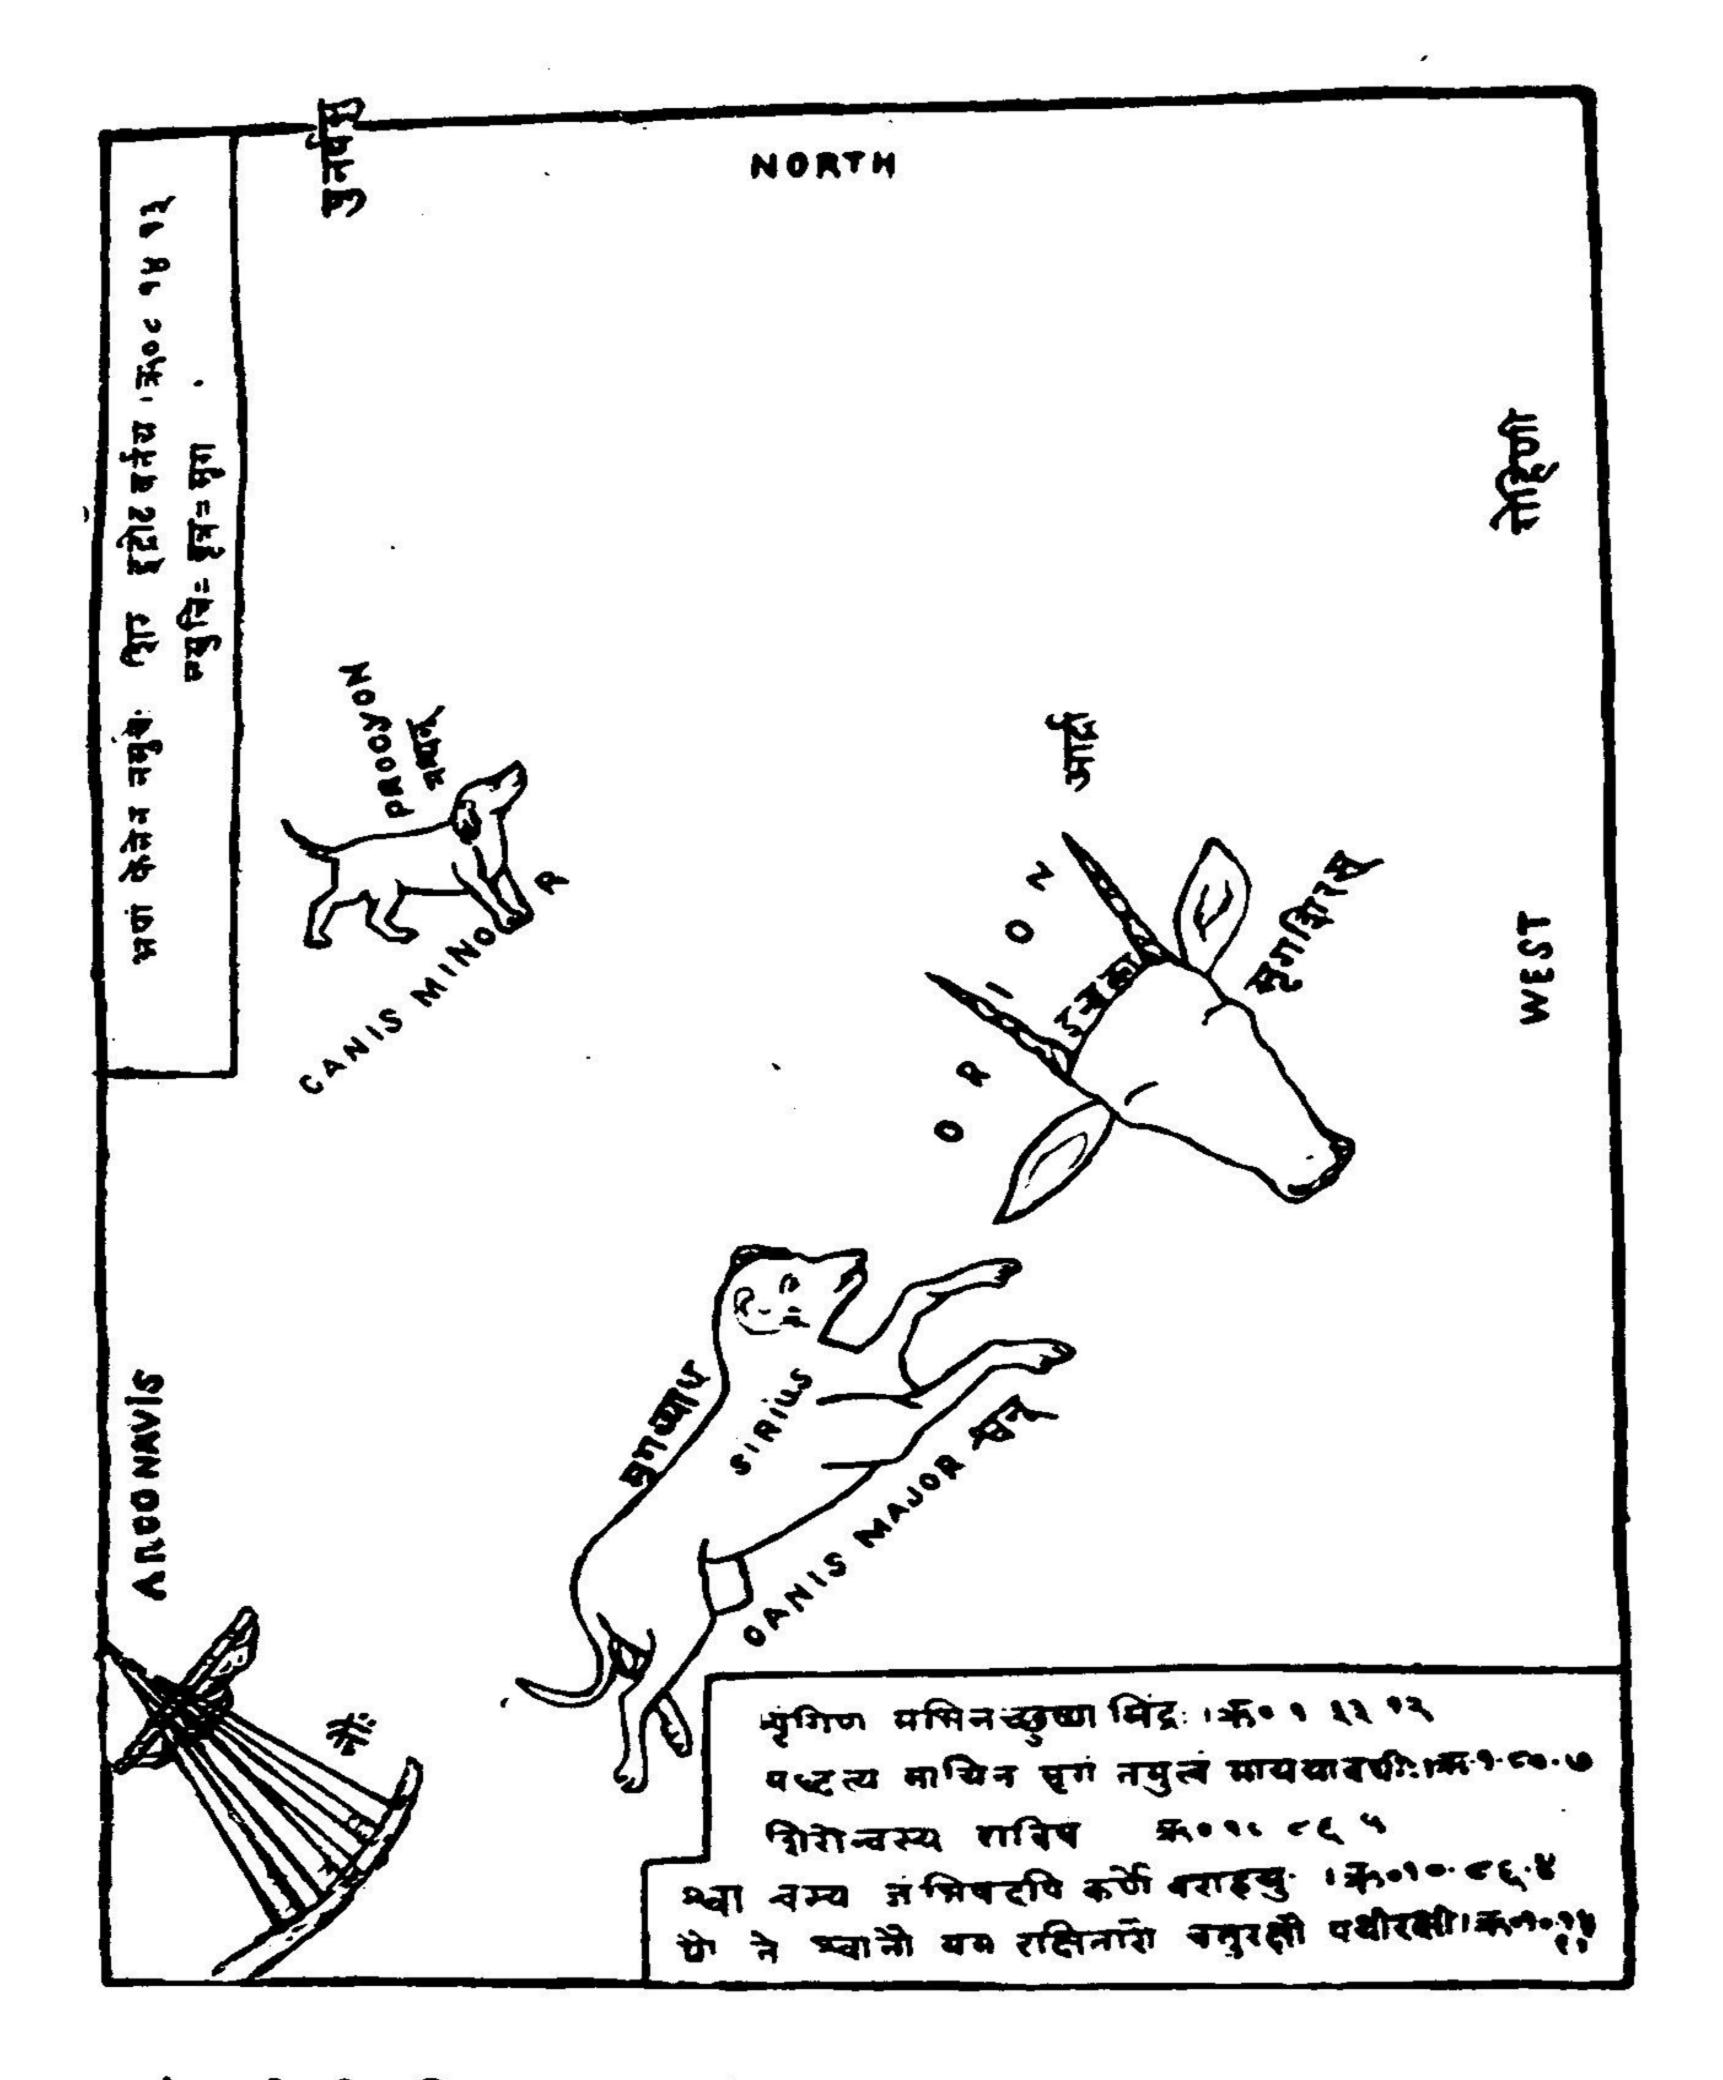

[†] Called Vaitaranî. The Garuda Purâna, Pretak. vi. 25—31, states that a cow should be given to a Brâhman to enable the deceased to pay he ferrymen on this river.

near it the constellation of Argos (ship) and two dogs-Canis Major and Canis Minor—one on each side to guard both the entrances of the Chinvat Bridge across it. The Rigveda also mentions two dogs of Yama kept to "watch the way." while the Greeks place a three-headed dog at the gates of hell. In Rig. x. 63. 10 we are further told that the land of the blessed is to be reached by "the celestial ship with a good rudder."* The words in the original are daivim navam. Comparing these with the expression divyasya shunah in the Atharva Veda vi. 80. 3, and seeing that a celestial (divya) representation of Rudra is described in later workst it seems to me that we must interpret the epithet to mean "celestial" and not simply "divine." Thus the Vedic works appear to place a celestial dog and a celestial ship at the entrance of the other world, and these can be easily identified with the Greek constellations of Argo Navis and Canis, if we suppose the Milky Way to be the boundary of Heaven in these days. I do not mean to say that these conceptions had their origin in the appearance of the heavens. On the contrary, a comparison with the non-Aryan legends shows it to be more likely that the heavenly bodies received their names from the pre-existing beliefs, about the other world, amongst the people. Herbert Spencer tells us that amongst the non-Aryan savage races the journey to the next world is believed to lie over land, down a river or across the sea, and that in consequence the practice of burying their dead in boats prevails amongst some of them. The North Americans,

श्वानं बस्तो बोधियतारमञ्जविष्संवत्सर इदमद्या व्यक्ष्यन। ऋ०१-१६१-१३. Spana. peshupana. Vd.xiii. 9. Spanem. zairitem. chathru chashmem. Vd. viii. 16. [See page 110, 111.

we are further told, say that the Milky Way is "the Path of Spirits,' the Road of the Souls,' where they travel to the land beyond the grave, and where their camp fires may be seen blazing as brighter stars." This coincidence between the Aryan and the non-Aryan legends makes it highly probable that the figures of the constellations were conceived by the Aryans according to notions of the next world prevailing amongst them at that time. It may be noticed, however, that the non-Aryan races do not connect the idea of time, e. g., of the year and the seasons, with these beliefs, while it is the chief characteristic of the Aryan legends. We are, for instance, told that the dog commenced the year (Rig. i. 161. 13) and that the Devayana comprised the three seasons of Vasantâ, Grîshma and Varshâ (Shat. Br. ii. 1. 3. 1).† It is this feature of the Aryan legends that is most important for the purpose of our enquiry, while the coincidence, above pointed out, confirms, in a remarkable way, the genesis of the Aryan legends here proposed. The chief elements in the traditions of the three Aryan nations may thus be satisfactorily explained.

It may, however, be contended that the two dogs of Yama spoken of in the Rigveda may not be the same as the Avesta dogs at the Bridge. A closer examination of the several passages in the Rigveda will, however, dispel such doubts. In the Vendidad xiii. 9, the dogs are called peshupana, or those that guard the way to the region of death. The Avesta dog is chathru-chashmen (Ved. viii. 16), while the Vedic dogs are described as chatur-akshau (Rig. x. 14. 11), both of which expressions mean "four-eyed." The dogs in the Avesta and the Rigveda, however, differ in colour. In Ved. viii. 16 the

^{*} Principles of Sociology, Vol. I., chap. xxiv., p. 399, 1st Ed.

[†] For German legends, indicating time, see the next chapter.

dogs are said to zairitem or spaetem zairi-gaoshem, yellow or white with yellow ears; while the dogs of Yama are said to be shabalau, spotted or variegated. But the difference is neither very material, nor such as cannot be accounted for. In the Rigveda we can trace the yellow colour of the Avesta dogs. The antelope of the sun in Rig. x. 86. 3 is said to be harita or yellow, the zairetem of the Avesta, and if we suppose this antelope to be no other than that represented by Orion, as the sun commenced the year at that point, we need not be surprised if the dogs in the Avesta are described as yellow, especially when in the Atharva Veda viii. 1. 9. we find the two messenger dogs of Yama named as Shyama and Shabala, thus noting probably a difference in colour. The Atharva Veda iv. 20. 7 mentions a four-eyed bitch, while in the Shatapatha Brâhmana xiii. 1. 2. 9. the adjective is applied to a dog; and the same animal is evidently intended in both places. In the Parsi scriptures the dogs at the Chinvat Bridge are sometimes spoken of in singular (Ved. viii. 16) and sometimes, as in Rig. x. 14. 11, in dual (Ved. xiii. 9). This shows that we might disregard gender and number in the description of these dogs; and we are thus led to suppose that Sarama in the Rigveda is again to be identified with the dogs that watch the gates of heaven. Whether Sarama in primitive days was or was not connected with the dawn, I do not undertake to say. But there is an incident in her story which confirms the identification I have proposed. The Panis tried to coax Saramà by offering her milk which she drank. On her return she denied having seen the cows of Indra, who thereupon kicked her and she vomited the milk. Now the mention of

^{*} See Max Muller's Lectures on the Science of Language, Vol. II., p. 511.

milk at on ce suggests the idea that it must be the milk in the galaxy on each side of which the two dogs are stationed. In Rig. iv. 57. 5 Shunasîrau are invoked in order that they may pour down upon the earth the "milk," which they "make in heaven." Prof. Max Müller records a suggestion that Shunâsîrau, here spoken of, may be a very old name for the Dogstar, and with its derivative Sairya would give us the elymon of Seirios! * In Rig. vii. 55. 2 the Vastoshpati, "the guardian of the house," in the form of a dog, is invoked and described as bright and red Sarameya on whose jaws spears seem to glitter: a description which answers so well with the appearance of Sirius, that with what has been said above we may at once identify the Sârameya with the Dog-star. I may here refer to the Shatapatha Brâhmana ii. 1. 2. 9, where speaking of Mrigashiras, the Prajapati's body pierced by Rudra is described at his vástu. May not Vastoshpati be regarded as guardian of this? If so, it may be a further proof that Vastoshpati represents the star Sirius, which, as it were, guards the head of Prajapati in the form of Orion or the antelope's head. But, apart from this suggestion, I would finally quote Rig. i. 161, 13, where it is expressly stated that "the dog awakened" the Ribhus, the genii of the seasons, at the "end of the year!" Sâyana proposes to interpret shvanam in the original by "wind," but it is evidently an error. In the Shatapath a Brâhmana xiii. 5. 1. 8, vrika and shvâ are mentioned together, and the former is known to be a name for a wild dog. If so, Sâyana's explanation of Rig. i. 105. 11 appears to be more probable than that of Yaska. It is in fact a description of the dog (star) appearing in the east after

[•] Max Muller's Lectures on the Science of Language, Vol. 11. p. 526.

crossing "the eternal waters" of Yamaloka, and then being immediately lost in the rays of the sun, which rising after it, had to push the wild dog out of his way. The mention of the "eternal waters" of the Yamaloka indicates that the heliacal rising of the Dog-star, here referred to, occurred at the end of the Pitriyana or at the vernal equinox, thus further confirming the statement that the dog commenced the year. There are other passages of similar import, but as I wish to avoid, for the present, any disputed passages, I do not mention them here. If the time, I am contending to establish for the hymns of the Rigveda, comes to be accepted, it is sure to furnish an unerring clue to the interpretation of many other passages and legends in that sacred book, but the work must be left to be done hereafter.

Putting all these passages together, we find that in the Rigveda, dogs are described as dark and brown, bright and red, possessing four eyes, guarding the house and the way to Yama's region, vomiting and making milk, and above all beginning the new year. All these facts clearly show that the Vedic dogs are the same as the Hellenic or the Iranian, and we can easily and satisfactorily account

Prof. Bloomfield's theory leaves many of these facts unexplained. If the dogs represent the sun and the moon, how can the sun tell the Ribhus that the dog awakened them at the end of the year? I cannot also understand how the sun and the moon can be described as variegated in colour, or as engaged in making milk. Again how can the sun or the moon be said to be four-eyed, and why should they perpetually remain at the bound ary of heaven and hell? In Rig. x. 86, 4, a dog is said to be let toose at the ear of the Mriga, and this as well as the dog in Rig. i, 161, 13, must be supposed to be different from Yama's dogs, if we accept Bloomfield's view.

was near the Dog-star in those days, thus making the dog rise with the sun in the beginning of the year at the gates of the Devayana. We can now also understand how the dogs could have been described as four-eyed. For, if they are correctly identified with Canis near the Milky Way, then the four stars in the body of Canis might naturally be said to be his eyes; for once the number of eyes is increased from two to four, we need not expect to find them all on the head, but, like the thousand eyes of Indra in the later mythology, they may be regarded as spread over the whole body. M. Darmesteter rightly observest that "the Parsis being at a loss to find four-eyed dogs interpreted the name as meaning a dog with two spots above the eyes; but it is clear that the two-spotted dog's services; are only accepted

In Rig. x. 127. 1, the stars are said to be the eyes of night. The Greeks entertained a similar idea. Their Argos was surnamed Panoptes, "the all seeing," having a hundred eyes on the body. See Max Muller's Science of language, Vol. 11., p. 416.

[†] Sacred Books of the East Series. Vol. IV.; Zend Avesta, Part 1.; Intr. v. 4.

[†] These services are required at the funeral ceremony. It may be here noted that the hymn in the Rigveda which describes Yama's dogs (Rig. x. 14) is still recited at the time of burning the dead body of a Hindu. Every Brahman has also to give, every day, two small offerings of cooked rice to the two dogs of Yama, Shyama and Shabala, at the time of the Vaishvadera sacrifice. The offerings are placed on the ground in the form of a circle, beginning with the castern point. The offering to Shyama is placed outside the circle at the south west and that to Shabala at the north-west point. In other words, Shyama and Shabala are placed on each side of the western point, in the same way as the dogs appear in the heavens on each side of the l'lilky way.

116

for want of a four-eyed one, or of a white one with yellow ears." Evidently the Parsi priests failed to realise that it was the divine or heavenly, and not an earthly dog that was here described, as driving the death-fiend. The Atharva Veda vi. 80. 3 shows that the Indian priests of the time well understood it to mean a dog who is "born of waters, whose house is in the sky, and who sheds his lustre all around."

There is another set of traditions which we can similarly explain on the supposition with which we have started, viz, that the vernal equinox was then in Orion. The heliacal rising of the constellation at the beginning of the year marked the revival of nature at the commencement of spring, and the asterism may thus be said to represent all these milder influences which in later mythology were fully embodied in the conception of Vishnu. But the case was completely reversed if we take the acronycal rising of the same. It was at the autumnal equinox that the Dog-star rose at the beginning of night, and though, strictly speaking, it marked the end of Varshā, yet the portion of the heaven wherein the constellation is situated could have been easily regarded as the battle-ground of Indra and Vritra who fought in those days, and also as the stage on which the terrible Rudra made his appearance. In short, the constellation naturally became the harbinger of the mild and the terrible aspects of nature. It is in this latter sense that the Dogstar might be considered a rain-star, and Saramâ, like the Greek Hermes with which it is identified, might be said to have been sent to search for the cows of Indra taken away by the Panis of the nether word. The Greek legends mention

Kerberos has been etymologically identified with Sharvara and Orthros with Vritra. But no explanation has been given of how this Vritra came to be stationed at the gates of hell. Prof. Max Müller suggests that Orthros is the dark spirit that is to be fought by the sun in the morning. But then, this does not explain why it was called Vritra, and how it came to be killed by Herakles. The legend of Namuchi, as given in the Rigveda and interpreted on the supposition that the year began with the Dog-star, does, however, solve the difficulty. I have already alluded to the fact that in the Rigveda Vritra is often said to appear in the form of a Mriga (Rig. i 80.7; v. 32. 3; v. 34. 2; viii. 93. 14). In Rig. vii. 19. 5 Vritra and Namuchi are both said to be killed by Indra, and though this cannot be taken as a direct authority for holding that Vritra and Namuchi are the different forms of the same enemy, yet from the description of the two I do not think there can be any doubt as to their being identical. In fact, Shushna, Pipru, Kuyava and Namuchit are only so many different names of the enemy of Ludra. Now Indra is represented as cutting off the head of Vritra (Rig. i. 52. 10), and also of Namuchi (Rig. v. 30.7; vi. 20.6). Combining these statements we get that Indra cut off the head of Vritra or Namuchi, in the form of a Mriga; and this at once suggests the question whether that head is not the same as that of Prajapati cut off by Rudra and which gave the name of Mriga-shirsha, or "the antelope's head" to the constellation. In Rig i 53. 7, we are simply

^{*}Max Müller, Gifford Lectures, 1891, p. 248. Biographies of Words, p. 197.

[†] See Prof. Bloomfield's contributions to the Interpretation of the Veda in the Journal of the American Oriental Society, Vol. XV., p. 146.

told that Namuchi was killed by Indra in the distant (paravatt) region, which seems to mean the region of Yama. But as it does not satisfactorily determine the place where Namuchi was killed, I refer to Rig x. 73. 7, where Indra by killing Namuchi is said to have cleared up 'the paths leading (yana in the criginal) to the (region of) Devas;" which plainly shows that Namuchi was killed at the gates of the Devayana. In the Vâjasneyi Sanhitâ 10. 14 a sacrificial rite is described which gives the same place and time of Namuchi's death. The priest there throws away a piece of metal hidden under a tiger hide, exclaiming, "the head of Namuchi is thrown away," after he has taken his Yajan ana through all directions (East, South, West, North and upwards) and also through all the seasons (Vasanta, Grishma, Sharad, Varsha and Hemantaand-Shishira). This means, if it can mean anything, that Namuchi alias Vritra was killed, in the language of seasons, after Shishira, or in other words, at the gate of the Devayana as described in the above quoted passage from the Rigveda, for the end of Shishira is the end of the Pitriyana. Here then we have an explanation of how Orthros came to be at the gate of hell, or in a distant region under the setting sun. But the association of Orthros with Kerberos throws further light on the subject. If Vritra's head is the same as Mriga-shirsha, as explained in the beginning of this chapter, then the three stars in the belt of Orion, which form the top of Mrigashiras, might have easily suggested the idea of a three-headed monster. In Rig. x. 99. 6

^{*} The original verse is as follows:—
स्वं अवंध वसुधि सल्स्युं दासे कृष्वाव ऋषे विमायं।
स्वं चढ्यं मनवे स्वोवान्यको देवजांकसेव वा गान् ॥

Indra is said to have killed a three-headed and six-eyed monster. It might be contended that the explanation is not satisfactory, inasmuch as the head of Mriga is here supposed to be again conceived as a dog, while there is no authority in the Vedic works expressly describing Mriga as a dog. But if Orthros has become a dog in the Greek mythology, while it is a Mriga in the Vedas, I see no reason why Kerberos should not get his three heads from the Trishirshan of the Vedas. The difficulty is not at all a serious one. In bringing together the traditions of the three Aryan races after thousands of years, we must make some allowances, and be satisfied with a general similarity of the stories. The asterism of Mrigashiras and the dogs are so close, that one might be easily mistaken for the other, when all the knowledge of the original traditions was lost. It is thus that we can account for the fact that out of the three beings that were represented in this portion of the heavens, Rudra (the hunter) Mriga (the antelope), and Shvå (the dog), the Greeks retained in the sky only the hunter (Orion), and the dog (Kuone, Canis), with nothing to hunt, while the Hindus have not only forgotten, but condemned, the dog.

The Parsis, it is true, have not mistaken the dog, but still as regards complexion, they have represented their dogs as possessing the colour which in the Higveda is given to

^{*}The principal star in Canis Minor is still called Procyon = Gk. Prokuon, Sk. Prashvan, the Foredog. It shows that the previous star was once called Kuon by the Greeks. If we count the Nakshatras in the direction of the sun's annual course, Kuon comes first, and Prokuon afterwards. Cf. Sanskrit Râdhâ and Anuradhâ, of which, like Procyon, later writers have only retained Anuradhâ. Phalgunt. Ashâdhâ, and Bhâdrapadâ are similarly divided into Parvâ and Uttarâ, the preceding and the foregoing.

the antelope of the sun. Another objection that may be urged against this identification is that we are required to suppose Mrigashiras to be once the head of Prajapati, and at another time that of Vritra. It must, however, be remembered that we do so on the express authority of the Rigveda, and that besides it is quite natural to suppose that once the antelope's head was said to exist in the heavens, Vedic poets vied with each other in weaving legends out of it. As an illustration I refer to Rig. x. 86. 5, where the poet describes Vrishakapi's head as cut off, but so on after Vrishakapi is told that it was an illusion, and that in reality it was some one else whose head was so severed (verse 18). This clearly shows that it was a period when legends were still being formed out of the "antelope's head."

We can now explain how later writers evolved a myth out of Namuchi's death. The story is given in the Tandya Brahmana (xii. 6. 8). There we are told that Indra and Namuchi came to a settlement that the former should kill the latter, neither during day nor by night, nor by any weapon, whether dry or wet. Indra therefore killed him with the foam of the waters at the junction of day and night, when it had dawned, but yet the sun had not risen. It is probably this circumstance that has led Professor Max Müller to suppose that Orthros represents the gloom of the morning. But the explanation does not account for the other

^{*}See also Taitt Br. i. 7. 1. 7; Shat. Br. xii. 7. 3. 3. Also the Puranas, Ramayana iii. 30. 28; Mahabharata Udyoga p. ix. 29. Prof. Bloomfield has collected all such passages in his article on the contributions to the Interpretation of the Veda in the Journal of American Oriental Society, Vol. XV., pp 148 158.—The legend of Hiranya Kashipu in the Puranas appears to have been based on Namuchi's story.

incidents in the story. Was Namuchi or Vritra killed every morning by Indra? Or was it only at the beginning of the rainy season? Evidently the latter. We must then suppose that Namuchi was killed after dawn, but before the actual daybreak, at or during the monsoons. In other words, the junction of day and night in the later myths must be understood to mean a particular junction of day and night in the rains, or more definitely, the junction of the day and the night of the Gods—the junction of the Pitriyana and the Devayana, the gates of which are said to be cleared up by Namuchi's death in the passage from the Kigveda given above. The latter part of the legend is, however, still more poetical, and Prof. Max Müller's theory leaves it entirely unexplained. Indra is here said to have killed Namuchi with a weapon which was neither dry nor moist—the watery froth. This is evidently based upon Rig. viii. 14. 13, where Indra is described as "cutting the head of Namuchi with the foam of waters," and the same incident is again referred to in Rig. x. 61. 8. Therefore, even if we reject later speculations with respect to "why foam or froth should have been used," and decline to solve the question by assuming a compact between Indra and Namuchi, yet we have to account for the fact that in the Rigveda itself Indra is said to have used the foamy weapon to destroy his enemy. What could this foamy weapon be? If Namuchi was killed at the

^{*} Prof. Bloomfield has discussed this legend in a recent number of the Journal of the American Oriental Society (Vol. XV., Number II.), but he gives no explanation of the compact between Indra and Namuchi. In my opinion it is impossible to hold that the compact could have been the original basis of the legend. It is evidently a later invention to explain what were then deemed otherwise inexplicable incidents in the legend; and until these incidents are explained in a natural way, the legend cannot be said to be properly understood.

gates of the Devayana and his head still lies there, the watery foam could be no other than the broad belt of the Milky Way which crossed the heavens at the same part. The blue vault of the heavens is often compared to an ocean in the later Sanskrit literature,* and the stars are said to be the patches of foam upon its surface. Thus in the Mahimna Stotra, which is considered to be at least seven or eight hundred years old; the author describes (verse 17) the heavenly form of Rudra (i. e., Rudra as represented in the sky), and tells us that the stream of waters on his head has "the beauty of its foamy appearance enhanced by a number of stars.' † This is a description of the Ganges on the head of the celestial form of Shiva, and the author of Mahimna, who, in verse 22, refers to the story of Rudra piercing Prajapati with an arrow, and says that the whole story is still illustrated in the sky, I evidently meant to

*Cf. Sâhitya Darpana 10, where under अपहुति we have—
नेदं नभोमदलमंबुराशिनेताश्च तारा नवफेनभंगा: ।
वियद् व्यापी तारागणगुणितफेनोद्गमरुचि:
प्रवाहो बारां य: पृषत्कघु दृष्टः शिरसि ते ।
जगदद्वीपाकारं जलिधवलयं तेन कृत—
भिस्रननैवोक्षेयं धृतमाहिम दिग्यं तव वपुः ॥

The conception of Shiva embodied in this verse is really a grand one. The poet asks his readers to imagine how great must thiva be, the celestial stream on whose head encircles the Universe! The Milky Way which girdles the celestial sphere cannot be better described.

प्रजानाथं नाथ प्रसममाभिकं स्वां दुहितरं गतं रोहिन्तूतां रिरमियषुमृष्यस्य वपुषा । धनुष्पाणेर्गातं दिवमपि सपत्राकृतममुं त्रसंतं तेऽद्यापि स्यजति न मृगव्याधरभसः ॥

Also Cf. Shâkuntalâ, i., मृगानुसारिणं साक्षात्पश्यानीव पिनािकम् ।

describe by it the Milky Way which passes over the head of the star of Rudra. Now if the poetic imagination of the author of Mahimna can perceive foam in the Milky Way, I see no reason why the virgin imagination of the Vedic poets should not rise to that pitch. Dr. Haug, speaking of the Vanant Yastha, observes that the constellation (Vanant), by which the Parsi Dasturs understand the Milky Way is said to stand directly over Hell, and further, "the Dasturs are of opinion that this constellation is the weapon (Vazra) which is constantly aimed by Mithra at the head of the Daevas, as stated in the Khurshed Yasht." Referring to the Khurshed Yashta we simply find that the club (Vazia) of Mithra "was well struck down upon the skulls of the Daevas."† The information given to Dr. Haug may therefore be traditional among the Parsi Priests; but whether traditional or otherwsie as it comes from an independent source, it is strong corroborative evidence to support the identification of Indra's foamy weapon, with the stream of the Milky Way in the heavens. With the vernal equinox near the Dog-star, the Milky Way, which then separated the region of gods from that of Yama, could weil be said to be over Hell and "well struck upon the heads of the Daevas." Namuchi's legend can thus be simply and naturally accounted for, if we assign to the equinoxes the position which we have deduced from other passages in the Vedic works. I may point out that we do not hereby account for the original idea of Vritra. That is evidently a still older legend. But his existence at the gate of Hell and his decapitation by the foamy weapon—the two chief elements in the later Vedic traditions are satisfactorily

^{*}Dr. Haug's Essays on the Parsis p. 271, Note.

[†] Saered Books of the East Series, Vol. XXIII. Zend Avesta, Part II., p. 87.

explained by placing, as originally proposed, the vernal equinox in the constellation of Orion, and identifying Namuchi alias Vritra with the constellation of Mrigashiras or the antelope's head, situated just below the Milky Way.

We have next to deal with the legends of the bold hunter, the terrible Rudra chasing the antelope. Several attributes in the Purânic mythology, e.g., his bearing the Ganges, in his matted hair, his fondness for the burning ground, and his appearance as Kirâta or hunter, are all accounted for by placing Rudra just below the Milky Way or the celestial Ganges, at the gates of the Pitriyâna and figured as a hunter. I have already alluded to the difficulty of identifying Rudra. But whether we take the star of Ardra or Sirius to represent the lord of cattle, the above attributes remain the same. But neither these legends, nor the story of Rudra chasing Prajapati, which, so far as it was necessary for our present purpose, has been already given, can help us, in a material degree, to solve the question under consideration. I wish, therefore, to deal here only with such traditions as point out to the position of Rudra in the course of the year. Rudra, as the lord of the cattle and the presiding deity of storms, can be at once recognized and placed in the rainy season. There are, however, other legends indicating time more definitely. In Rig. x. 192. 2, Samuatsara or the year is said to rise out of the ocean, the place where Vritra was killed (Rig. x. 68. 12). Prajapati, as represented by Orion, may also be naturally supposed to commence the year when the vernal equinox was in Orion. Rudra killed Prajapati, and as I have shown before, Prajapati, Samvatsara; and Yajna

[·] See Mahimna Stotra, verse 17, quoted supra.

were convertible terms. Rudra therefore killed Prajapati or Yajna at the beginning of the year; and Yajna also meant sacrifice. Rudra was therefore naturally believed to have killed the sacrifice—thus giving rise to the Purânic legends of Rudra routing the sacrifice of Daksha. At the end of the Sauptika Parva in the Mahâbhârata we are told that "Rudra pierced the heart of Yajna or Sacrifice with an arrow. Thus pierced the Sacrifice, with fire, fled away in the form of an antelope and having reached the sky. there shines in that form, followed by Rudra." Thus it was that Rudra acquired the title of Sacrifice-breaker. In the Tandya Brâhmana vii.2.1, the death of Prajapati is, however, spoken of as voluntary. In Taitt. Br. iii. 9. 22. 1, he is said to have assumed the form of Yajna and given himself up to the Devas to be sacrificed. The Devas killed him on their morning, and so every one should similarly perform the Ashvamedha sacrifice at the beginning of the year. One can now understand what the meaning of these stories is. They refer to the death of Prajapati by Rudra at the beginning of the year; and thus it was that Yajna meaning the vear was sacrificed by means of Yajna or Prajapati, Rig. x.90. 16., where we are told that Gods sacrificed Yajna by Yajna, but this (human sacrifice) was an old (out of date) practice, may also be similarly interpreted. I cannot say which of

ततः स यज्ञं विष्याध रौद्रेण हृदि पात्रणा । अपकांतस्तता यज्ञो मृगो भूत्वा सपावकः ॥ स तु तेनैव रूपेण दिवं प्राप्य ब्यराजत । अन्वीयमानो रुद्रेण युधिष्ठिर नमस्तले ॥

Here the antelope is said to be pierced in the heart and not in the head as int the Vedic works. It appears, therefore, that the whole antelope was considered to be in the heavens at this time.

^{*} Mahâ. Saupt. 18, 19, 14 :-

these legends is older, whether that of Prajapati sacrificing himself, or of Rudra killing him at the beginning of the year. But whichever of these be the older one it does not affect our present question. Both of them indicate that Prajapati once commenced the vear and that he either willingly allowed himself to be sacrificed or was killed by Rudra at that time. As another indication of time, I may point out that the time, prescribed for the sacrifice of Shulagava in Ashvalâyana Grihya Sútras, 4.9.2, is in Vasanta or Sharad with the asterism of Ardra. The passage, as now understood, means that the sacrifice should be performed on any day in Vasanta or Sharad when the moon-whether full, half, quarter or new-is near the asterism of Ardra, the star over which Rudra presides. But it appears to me that here we have a tradition that the sacrifice was originally required to be performed at the new or full moon in the vicinity of Ardra, in Vasanta or Sharad, thus indicating that the vernal equinox was near Ardra when the sacrifice was orginally established. When the seasons receded Ardra new or full moon could not fall in Vasanta or Sharad and therefore Ardra night afterwards came to mean any night when the moon is near the asterism of Ardra in Vasanta or Sharad. However, as the point is not quite satistactory I shall not press it here. The only other fact about Rudra worthy of notice is that he seems to be described as followed by dogs or rather as their master (Vaj. San, 16. 27). This may shew that the Vedic poets knew of the dogs near the star of Rudra.

^{*} In the original there are salutations to several forms of the deity, but it would not be quite safe to infer from it that Rudra was, as a matter of certainty, followed by dogs. In Tand. Br. xiv. 9, 12, Shiva is described as Mrigayu, while the passage in Vaj. San. (16. 27) says श्रीनेभ्यो मृगायुभ्यश्व...नमः।

I have already alluded to the Parsi legends of the Chinvat Bridge and the dogs that keep it. There is, however, one more circumstance to which I wish here to refer. The star Tistrya has been identified with Sirius and the identification, isnot absolutely correct, is at least sufficiently so for general purposes. But I think that the word itself has not been yet satisfactorily explained. I propose to derive Tistrya from Tri-stri which in Sanscrit means three-stars. Tri-stri may easily be corrupted into Tistri, Tister. Tister is, therefore, the same as Kerberos or trishiras and the fact that Tistrya is called Tir or arrow in Modern Persian further confirms this derivation, for the Aitareya Brâhmana (iii. 33) calls it the three-starred or tripartite arrow of Rudra in the sky. I have in the last chapter shown that if we commence with the summer solstice and regard Fravashinam as the first month of the year, Tistreye corresponds to Margashirsha. If Tister is understood etymologically to mean the belt of Orion this coincidence of the months can be better accounted for. I am therefore of opinion that Tistrya should not be identified with Sirius, but with the belt of Orion. We can then better understand why the star should have been spoken of as Tristryeni probably indicating more stars than one and also Pauryeni, the first. The Parsis have preserved

As the word is understood at present it means "pertaining to or belonging to Tristrya." But grammatically it may mean "many stars or group of stars." I may here point cut that if we identify Tistrya with Sirus the ctymology is not explained, nor can we account for the modern Persian name Tir which again means an arrow. While if we identify Tristrya with the three stars in the belt everything is satisfactorily accounted for. All the arguments based upon the "rain producing" influence of the star are equally applicable in either case, since both the stars (Sirius and Orion) rise at the same time. Sec Dr. Geiger's Civil of Bast Iran., Vol I., pp. 141-142.

another interesting relic of the asterism of Mrigashiras, but I reserve it for the next chapter.

Starting with the supposition that the vernal equinox was in Orion, we have thus an easy and a simple explanation by which the three principal deities in the Hindu mythology can be traced to and located in this part of heavens. Vishpu representing the happy times of Vasanta, Rudra presiding over storms and Prajapati, the deity of sacrifices beginning the year, were all combined in one place. It was here that Vishnu killed Varaha (Rig. i. 61. 7); it was here that Indra killed Vritra, and it was here that Rudra chased Prajapati, in the form of Yajna or that he sacrificed himself. The celestial Ganges separating the upper and the neither world was also in the same quarters, and through it lay the path to Yama's region. In a word the Trinity of the Hindu Pantheon was fully represented in the constellation of Orion, when the vernal equinox was there. Later writers describe this trinity as represented by the three-headed Dattatreya, followed by the Vedas in the form of dogs; and after what has been said above, I think we can have no difficulty in identifying this personified Trinity with Orion having three stars in the head and closely followed by the dog (Canis) at its foot. It will be difficult to find another place in the heavens where all these elements are combined in such an interesting manner.

CHAPTER VI. ORION AND HIS BELT.

Agrahâyana = Âgrayana in the older works—Probable derivation of hâyana—The Âgrayana sacrifices—Their number and nature—Performed every half-year in Vasanta and Sharad—Greek legends of Orion—Their similarity to Vedic legends—German traditions and festivities—Stag and hind—Twelve nights—Dogdays—All of which indicate the commencement of the year in Orion—Dr. Kuhn's explanation is insufficient—The usual adjuncts of Orion—His belt, staff and lion's skin—The aivyaonghana of Haoma in the Avesta—The yajnopavíta of the Brâhmans—Their sacred character probably borrowed from the belt of Orion or Yajna—Use of mekhalâ, ajina and danda in the Upanayana ceremony—Probably in imitation of the costume of Orion or Prajāpati, the first of the Brâhmans—Derivation of Orion from Âgrayana—Its probability—Phonetic difficulties—Conclusion.

In the last chapter I have quoted an observation of Plutarch that the Greeks gave their own name to the constellation of Orion, and have there discussed some Vedic legends which corroborate Plutarch's remarks and indicate that the vernal equinox was in Orion at that time. In the present chapter I mean to examine other legends which go to shew that the constellation of Orion was known and figured before the Greeks, the Parsis, and the Indians separated from their common home, and that the legends or the traditions so preserved, and perhaps the name of the constellation, can be naturally and easily explained only on the supposition that the vernal equinox was then near the asterism of Mrigashiras.

I have already shown that Agrahâynî if not Agrahâyana, can be traced back to Pâṇini's time, as the name of a Nakshatra, and that it is a mistake to derive it from the name of the full-moon day. We have now to see if we can

0

trace back the word still further. The word hâyana does not occur in the Rigyeda, and it may be doubted if the name Agrahayanî was in use in the old Vedic days. Hayana is, however, used in the Atharva Veda (viii. 2. 21; xi. 6. 17) and in the Bráhmanas; and may be compared with Zend Zayana meaning winter. Pânini (iii. 1. 148) derives hâyana from $h\hat{a} = to$ go or abandon, after the analogy of $g\hat{a}yana$ and gives two meanings, viz, the grain 'vrîhi' and 'time.' Whether we accept this derivation or not, it is at any rate clear that the word was used in Pânini's days, to denote a division of time and a kind of grain, and I think we can better account for both these meanings of hayana by connecting the word with ayana and Agrayana or the halfyearly sacrifices. Dr. Geiger, speaking of the old Parsi calendar observes that "probably the half-year was more employed in civil life than the complete year." * Now whether the observation be entirely correct or not, we can, I think at any rate, assume that the division of the year into two equal halves is an old one. I have already discussed the two-fold division of the year into Devayana and Pitriyana and its coincidence with the passage of the sun to the north and the south of the equator. Ayana in the sense of such a division thus appears to be an old word and by prefixing h to it we may easily get hayana subsequently changed into hâyana like the words in the Prajnadi list, wherein this word was not included as it was derived by Panini in a different way. The insertion and omission of h when

[&]quot;Dr. Geiger's Civ. East, Iran., Vol. I., p. 152. Dr. Schrader makes a similar observation. "For all these reasons (most of which are philological) I believe we have the right to presuppose an original division of the Indo Germanic year into two seasons." Preh Ant. Ary. Peoples, Part IV., chap. vi., p. 302

followed by a vowel at the beginning of a word is not uncommon even in these days, and there is nothing extraordinary if we derive hayana from ayana. Now by a natural process when we have two forms of a word or two derivatives of the same root they gradually come to be utilised for specific purposes, and so acquire distinct meanings. Sanskrit lexicographers class such words under Yogarûdha, meaning thereby that etymology and convention have each a share in determining their denotation. Hayana might thus come to exclusively denote a complete year, while ayana continued to denote a half-year as as before. † When ayana thus became hayana, Agrayana, which all lexicologists derive from agra+ayana, I would be changed into agra + hayana = Agrahayana; and when hayana was changed to hâyana in a manner analogous to the words in the Prainadi list (Pan. v. 4. 38) as stated above, Agrahavana would be altered into Agrahayana. We can thus account for the double forms-hayana and hâyana, Agrahayana and Agrahayana - which we find given in Böhtlingk and Roth's and other lexicons. while if we accept Panini's derivation,

^{*} Cf. The derivation of the word 'history' from 'istory' in Max Muller's Lectures on the Science of Language, Vol. II., p. 329.

[†] Zend Zayano, denoting winter, probably preserves an older meaning, when hayana was used to denote the second of the two seasons (summer and winter) into which Dr. Schrader believes that the year was primevally divided. Some of the synonyms for the year in Sanskrit originally denoted particular season, e. g., Varsha, Sharad. Sama and Hayana may be similarly supposed to have been derived from the names of the half-year or ayana.

[†] This derivation would give us Agrâyana instead of Agrayana and native grammarians obtain the second form from the first by the interchange of the initial vowel with the following long a.

hayana will have to be either thrown out as incorrect or derived otherwise. In Amara ii. 8.52, hayana occurs as a different reading for dayana in the sense of a vehicle and Bhânu Dikshita derives it from hay to go; but we might as well ask if hay, ay, and i, all meaning to go, are not the different forms of the same root. As far as the form of the word is concerned we may therefore derive hâyana from hayana and the latter again from ayana and similarly Agrahâyana from Agrahayana and this again from Agrayana

I may, however, remark that the process which appears so simple according to the modern philological rules, was not recognized by the native grammarians. There are good many words in Sanskrit which can be thus easily derived on the principle of the insertion and omission of h. Thus we have invaka and hinvaka both meaning the stars on the top of Mrigashiras, and atta and hatta denoting a marketplace. But native grammarians, including Pânini, would not derive the words from each other, as we have done above in the case of ayana and hayana. Their method is to give two different roots for the two words, thus we have two Vedic roots hinva and inva or hiv and it, both meaning to go, to please, the one giving us hinvaká and the other învaká. At and hat, an and han, ay and hay, i and hi are further instances of the principle adopted by the native grammarians in such cases. Really speaking this is not solving the difficulty, but only shifting it a stage backwards; for if any explanation is necessary to account for the double forms like ayana and hayana, it is equally required to explain why we should have the double roots like ay and hay, both meaning to go.

the words to their roots, did not push the matter further. With them ina is derived from i to go, ayana from ay to go, hayana from hay to go, and hâyana from hâ to go.* Whether and how far we can dispense with some of these roots is an important philological question, but it is not necessary for us to discuss it here. It does not much affect the point under discussion whether hâyana is derived from ayana, i. e., ay to go, or from hâ to go as Pânini has done. Etymologically both the words, ayana and hâyana, mean "going" and when both came to be used to denote a division of time, it is natural to suppose that they soon acquired special meanings. Thus while ayana continued to denote the half year; hûyana, which was comparatively a later word, might have been exclusively used to denote the complete year, and as the beginning of the first ayana was also the beginning of the year, $\hat{A}(a)$ grayana would be naturally changed into $\bar{A}(a)grahA(a)yana$ to express the beginning of the year. Whether we adopt Panini's derivation or the principle of modern philology we thus arrive at the same result, and so far as our present inquiry is concerned we can therefore suppose that the various words, which may be represented by $\bar{A}(a)gra(\hat{a})yana$, or $\bar{A}(a)grah\hat{a}(a)yana$, are all transformations or derivations of agra + ayana = A(a)grayana.

^{*}This method sometimes fails, and native grammarians who are not now at liberty to coin new roots, have to resort to the Prishodarâdi list. For example, we have two forms ilvalâ and hilvalâ as different readings for invakê in Amara i. 3. 23. Of these ilvalâ can be derived from il, to sleep, though the root meaning is not suitable, but h'Ivalâ cannot be even so derived and Târânâthâ in his Vâchaspatya would derive or rather obtain the initial h by Prishodarâdi. Similarly cf. Hintâla = hâla + Prishodarâdi!

Now as regards the meaning it appears to me that ayana at first denoted nothing more than the passage of the sun. Gradually it meant a division of time regulated by such passage. The Agrayana-ishtis thus appear to have originally meant the two half-yearly sacrifices performed on the first day of each ayana, which seems to be regarded somewhat like the new year's day at present. Gârgya Nârâyana, in his commentary on Ashvalâyana's Shrauta Sûtras (i. 2. 9. 1.) derives Agrayana from agra + ayana; but interprets it to mean a sacrifice which is followed by eating (ayana,) that is, which requires to be performed before the new harvest is used for domestic purposes. He thus takes ayana to mean eating, and as the Agrayaneshtis in later works like Manu (iv. 27) were described as "New-harvest sacrifices," all commentators have adopted this explanation of the word. But it appears to me to be evidently of latter origin and invented to account for the nature of the sacrifice when owing to the falling back of seasons the Agravaneshtis came to be performed not at the beginning of each ayana as they should have been, but at wrong times. The necessity of such an explanation must have been still more keenly felt, when instead of two halfyearly sacrifices, the Agrayanaishtis were performed thrice a year. Ashvalayana, it is true, gives only two, one in Vasanta and the other in Sharad, the old beginnings of the Devayana and the Pitriyana and the real commencement of the two ayanas But he has mentioned three kinds of grain that may be used, vrihi, shyamika and yava (i. 2. 9. 1,) and his commentator Gârgya Nàrâyana observes that yava and shyamaka are to be used simultaneously in Sharad (i.2. 9. 13). It appears, however, that the fact, that three kinds of grain were sanctioned for use, soon gave rise to three

Agrayana-ishtis-one in Vasanta with vrihi; the second in Varshâ with shyâmâka, and the third in Sharad with yava. But that it is a practice of later origin is evident from a passage in the Taittiriya Saphitâ (v. 1.7.3) which states that "twice is grain cooked for the year," clearly meaning thereby that there were only two Agrayana-ishtis in a year when the new harvest was first offered to gods. I am therefore of opinion that originally there were only two half-yearly sacrifices at the commencement of each ayana, and as vrîhi was used, on the occasion of the first of these ishtts, the word ayana or hûyana naturally came to denote the grain so used, and that ayana in Agrayana originally meant not eating as the later writers have imagined, but a half-year as the word usually denotes. This way of deriving and explaining the word is not a new invention. For notwithstanding the fact that Agrayana and Agrahayana are explained by Taranatha as referring to the sacrifice of grain and eating, yet he derives Agrayana, a word of the same group, from agra + ayana and explains it to mean that "the Uttarâyana was in its front." Even native scholars thus appear to be aware of the fact that Agrayana could be or was derived from ayana meaning the Uttarâyana. Indeed, we cannot otherwise account why the Agrayaneshtis were originally celebrated at the beginning of Vasanta and the end of Varsha as stated by Ashvalayana. The Agrahayanî of Amara is thus traceable to Agrayanî of the Vedic works; and perhaps it was the initial long vowel in the latter that might have been retained in the later form.

It may, however, be asked if there is any evidence to show that Agrayana was used to denote a star in the Vedic

^{*} See Vâchaspatya s. v. Agrayana.

works. That Amara, and long before him Panini, understood Agrahavani, if not Agrahayana, to mean the Nakshatra of Mrigashiras is undoubted; and I think we might fairly infer therefrom that the meaning given by these writers must have come down to them traditionally. Every ayana must begin with some Nakshatra, and it is quite natural to suppose that Agrayana must have gradually come to denote the star that rose with the first ayana. But I have not been able to find out a passage where Agravana is used in the Vedic works to expressly denote the constellation of Mrigashiras. I may, however, refer to the Taittiriya Sanhità (vi. 4. 11. 1.) wherein the vessels (grahas) used for sacrificial purposes are mentioned as beginning with Agrayana and considering the fact that two other vessels are named, as the words themselves denote, after the planets Shukra and Manthin,* we might suppose that Agrayana came to be included in the list, not as the name of a deity, for it was not such a name, but as denoting, the star which commenced the year, or the half-year. The word graha which in the sacrificial literature denotes vessel has been used in later astronomical works to denote the planets, the number of which, including the sun and the moon, is fixed at nine, the same as the number of the vessels used for sacrificial purposes. It is not, therefore, improbable that Agrahayani or Agrahayana of the later writers was a transformation of Agravana, and that Mrigashiras, was so called in old times for sacrificial purposes. When the Agrayaneshtis lost their primary meaning, Agravana or Agrahâ-

See infra Cnap. VII. In Taitt. San. iii. 1.6. 3 the vessel is described as the vessel of Agrayana, thus shewing that the vessel was named after Agrayana, which must therefore be either the name of a deity or of a Nakshatra.

when the sacrifice was performed than the Nakshatra at the beginning of the dyana, thus giving rise to the speculations previously discussed. But in whatever way we man explain the disappearance of Agrayana in the sense of Mrigashiras in the oldest Vedic works, the fact that in the days of Amara and long before him of Pânini Agrahâyan was used to denote the constellation of Orion remain unshaken, and we may safely infer therefrom that the mearing given by them was a traditional one.

We have already seen how legends gathered round th "antelope's head." It was the head of Prajapati wishin to violate his daughter, by which some understood th dawn, some the sky and some the star Aldebaran (Ait. Bi iii 33). Others built the story of Namuchi upon the sam which placed Vritra, at the doors of hell; while a third class o legend-makers considered that the death of Prajapati wa voluntary for the sacrificial purposes of the Devas. The following summary of the classical traditions about the death of Orion, taken from Dr. Smith's smaller Classical Dictionary, wi show how strikingly similar they are to the old Vedic legends.

"According to some, Orion was carried off by Eos (Aurora who had fallen in love with him; but as this was dis pleasing to the gods, Artemis killed him with an arrow in Ortygia." According to others, he was beloved by Artemis and Apollo † indignant at his sister's affection for him, asserted that she was unable to hit with he

^{*} Homer Od. v. 121. 4. See Gladstone's Time and Place of Homer, p. 214.

[†] Ov. Fast v. 537.

"arrow a distant point which he showed her in the sea. "She thereupon took aim, the arrow hit its mark, but the "mark was the head of Orion, who was swimming in the sea. A third account, which Horace follows, states that he offered violence to Artemis, and was killed by the god-"dess with one of her arrows."

Thus love, arrow and decapitation which are the three principal elements in the Vedic legends, are all present in these traditions. There is another story which says that Orion was stung to death by a scorpion; but this is evidently intended to represent the fact that the constellation of Orion sets when that of Scorpion rises in the east, and is therefore of later origin when the zodiacal signs were adopted by the Greeks.

There are other traditions which point out the position of Orion in the course of the year. The cosmical setting of the constellation was believed to be an indication of stormy weather and the constellation was called *imbrifer* or acquosus in the same way as the Shvâ in the Vedas is said to commence the year, while Shunasirau are invoked along with Parjanya for rain. The German traditions are, however, more specific, and I take the following abstract of the same by Prof. Kuhn communicated to the late Dr. Râjendralâl Mitra and published by the latter in his "Indo-Aryans," Vol. II., pp. 300-302:—

"Both in our ancient and modern popular traditions, there is universally spoken of the Wild Hunter, who sometimes appears under the name of Wodan or Goden, and was, in heathenish times, the supreme god of the ancient German nations. This god coincides, both in character and shape with the ancient Rudra of the Vedas (vide p. 99).

Now there is a class of traditions in which this ancient God is said to hunt a stag and shoot at it, just as Rudra in the Brâhmanas is represented as shooting at the rishya and rohit. The stag in German mythology, is the animal of the god Freyr, who, like Prajapati, is a god of the sun, of fertility, &c., so that the shot at that stag is to be compared with Rudra's shooting at the rishya = Prajapati. I have further endeavoured to show that some indications exist in the mediæval penitentials of Germany and England, which give us to understand that at the close of the old year and at the beginning of the new one (we call that time " diezwölften" or the twelve days, dvadashaha of the Indians) there were mummeries performed by the country people, in which two persons seem to have been the principal performers, the one of whom was disguised as a stag while the other was disguised as a hind. Both represented a scene, which must have greatly interested and amused the people, but very much offended the clergy, by its sordid and hideous character; and from all the indications which are given in the text, communicated by me (pp 108-180), we may safely suppose that the chief contents of this representation was the connection of a stag and a hind (or of an old woman), which was accompanied by the singing of unchaste songs. From English customs at the New-Year's Day, we may also infer that the hunter's shooting at this pair was even a few centuries ago, nay, is even now, not quite forgotten. Now as the time of the "twelve days" was with our ancestors the holiest of the whole year, and the gods were believed to descend at that time from heaven and to visit the abodes of men, we may firmly believe that this representation also was a scene of the life of the Gods. I hope

to have thus proved that the Brahmanical and the German traditions are almost fully equal, and I have finally attempted to lay open the idea from which the ancient myth proceeded. According to my explanations, our common Indo-European ancestors believed that the sun and the day-light (which was, so to say, personified under the image of various animals, as a cow or bull, a horse, a boar, a stag), was every day killed in the evening and yet re-appeared almost unhurt, the next morning. Yet a decay of his power was clearly visible in the time from midsummer to midwinter, in which latter time, in the more northern regions he almost wholly disappears, and in northern Germany, during the time of the twelve days, is seldom to be seen, the heavens being then usually covered all over with clouds. I have therefore supposed, it was formerly believed that the sun was then completely destroyed by a God, who was both a God of night and winter as also of storm, Rudra = Wodan. The relics of the destroyed sun, they seem to have recognised in the brightest constellations of the winter months, December and January, that is, in Orion and the surrounding stars. But when they saw that they had been deceived and the sun re appeared the myth gained the further development of the seed of Prajapati, from the remnants of which a new Aditya as well as all bright and shining Gods were produced. I have further shown that both Greek astronomy and German tradition proved to be in an intimate relation with the Brahmanical tradition; for the former shows us, in almost the same place of the celestial sphere, a gigantic hunter (Mrigavyadha, Sirius; Orion, the hunter Mrigashiras); whilst the latter has not yet forgotten that Saint Hubertus, the stag-killer, who is nothing out a

representative of the God Wodan, who had, like Rudra, the power of healing all diseases (the bhishaktama of the Vedas) and particularly possessed cures for mad dogs which not only were his favourite companions, but were also in near connection with the hottest season of the year, when the declining of the sun begins, the so-called dog-days."

Here is an equally striking coincidence between the German and the Vedic traditions. The mummeries were performed " at the close of the old year and at the beginning of the new one," and the stag and the hunter had therefore something to do with it. Prof. Kuhn's explanation does not clear up this point satisfactorily, nor does it give any reason why the festivals were celebrated only during the twelve days preceding the new year. As regards the decay of the sun's power it must have been observable during the whole season acd does not therefore in any way account for the selection of 12 particular days. As for the dvadashaha of the Indians, it is the period during which a person consecrates himself for a yearly sacrifice and so must naturally precede the commencement of the new year when the annual sacrifice commences, and I have previously shewn that it represents the difference between the lunar and the solar years; in other words, they were what we may now call the intercalary days added at the end of each year to keep the concurrence of the lunar and the solar measures of time. The German traditions therefore can be better accounted for, if we suppose that they are the reminiscences of a time when the stag and the hunter actually commenced the year. This also explains why the dog-days were considered so important. When Sirius or the dog-star rose with the sun at the beginning of the year, the dog-days, or rather the days when the dog was not visible, were

he new-year's days, and as such they were naturally invested with an importance which they never lost. I have already illuded to the passage in the Rigveda which states that the log awakened the Ribhus, or the gods of the seasons, at the end of the year, and this appears to me to be the origin of what are still known as dog-days in the western countries.)wing to the precession of the equinoxes and by neglecting o maintain the correspondence of the seasons the days now all during a period different from the one they did of old, out such differences we find in all cases where ancient rites or festivals are preserved. The feast of the manes, which he Parsis and the Hindus seem to have commenced together when the summer solstice occurred in the month of 3hàdrapada, now no longer coincides with the summer solstice; but for that reason we cannot say that it might not nave occured originally at the summer solstice, especially when the later supposition is supported by other reliable evidence, and gives a better origin of the festival. I am not herefore disposed to accept Prof. Kuhn's explanation as satisactory, and am of opinion that the German traditions are the eminiscences of a time when the vernal equinox was in Orion, the hunter. We cannot otherwise account why the mummeries and festivals should have been celebrated during the twelve lays at the end of the old and the beginning of the new year.

It will, I think, be evident from this that the Greeks and Bermans have preserved the memory of the days when the year commenced with the vernal equinox in Orion. I have previously shown that the Parsi primitive calendar, as fixed by Dr. Geiger, points to the same conclusion. The Parsis, he Greeks, the Germans and the Indians therefore appear to have separated after these traditions were formed and

coincidences are necessary to establish the Aryan origin of the constellation of Orion, as well as its position at the vernal equinox in old days. I shall, however, give one more coincidence which on account of its peculiar nature is alike interesting and important.

In the Greek mythology Orion, after his death as above described, was placed among stars, "where he appears as a giant with a girdle, sword, a lion's skin, and a club." Now, if as remarked by Plutarch, Orion is an original Greek name, we should find some traces of these various adjuncts of Orion or at least some of them in the old Iranian and Indian works. Do we so find them? I think we do, only if we look for them with a little more attention and care, for the transformation is more specific and peculiarly out of the way in this case. In the Vedic works Soma is said to be the presiding deity of the asterism of Mrigashiras. Soma is Haoma with the Parsis. The 26th verse in the Haoma Yasht is as follows:—

Frâ te Mazdáo barat paurvanim aivyûonghanem steher-paesanghem mainyu-tâstem vanghuhim-daenîm Mâzdayasnîm.

which has been thus rendered by Mr. Mills in his translation of the Zend Avesta, Part III., in the Sacred Books of the East Series (P. 238):—" Forth has Mazda borne to thee, the star-bespangled girdle, the spirit-made, the ancient one, the Mazda-Yasnian Faith." Dr. Haug takes paurvanim in the original to mean "leading the paurvas," which latter he believes to be the Persian name for the Pleiades, which is variously written parû, parvah, parvîn and parviz.† This keen-sighted suggestion of Dr. Haug has been pronounced

^{*} SeeSmith's Dictionary of Classical Mythology. † Dr. Haug's Essays on the Parsis, p. 182.

by Mr. Mills as "doubtful, and refuted by Vistasp Yasht 29, where Darmesteter renders a word probably akin as 'the many.'" But excepting this difference of opinion all agree in holding this Yasht to be an ancient one, "a reproduction of an Aryan original," and that the verse above given contains a description of the belt of Orion. Orion is Haoma, the Soma of the Indians which is its presiding deity in the Vedic works, and the above verse states that God has given a natural star-studded girdle to Haoma. This girdle is, therefore, no other than the belt of Orion. The verse in the Haoma Yasht, however suggests more than it denotes. Both Haug and Mills have used the word 'girdle' in the translation. But whether we use 'girdle' or 'belt,' it hardly conveys the idea of the original awyaonghanem. It is a striking instance of how in translations we sometimes lose the force of the original. Aivyaonghana is a Zend word for the kusti, or the sacred thread of the Parsis, which they wear round their waist. The 'girdle' or the 'belt' of Orion is thus said to be his kusti, and though we may have no more traces of the 'best' or the 'club' of Orion in the Parsi scriptures, the above verse at once directs our attention to the place where we may expect to find the traces of Orion's belt in the Indian works I have before pointed out that Orion or Mrigashiras is called Prajapati in the Vedic works, otherwise called Yajna. A belt or girdle or a piece of cloth round the waist of Orion or Yajna will therefore be naturally named after him as yajnopavita, the upavita, or the cloth of Yajna. The term, however, now denotes the sacred thread of the Brahmans, and it may naturally be asked whether it owes its character, if not

^{*} See Sacred Books of the East Series, Vol. XXXI., Zend Avesta, Part III., p, 238.

the origin, to the belt of Orion. I think it does on the following grounds.

The word yajnopavîta is derived by all native scholars from yajna + upavîta; but there is a difference of opinion as to whether we should understand the compound to mean an 'upavîta for yajna,' i. e., for sacrificial purposes, or, whether it is the 'upavîta of yajna.' The former is not incorrect, but authority is in favour of the latter. Thus the Prayoga-writers quote a smriti to the effect that "the High Soul is termed yajna by the hotris*; this is his upavita; therefore, it is yajnopavîta." A mantra, which is recited on the occasion of wearing the sacred thread means, "I bind you with the upavîta of yajna;"† while the first half of the general formula with which a Brâhman always puts on his sacred thread is as follows:—

यज्ञोपवीर्तं परमं पवित्रम् प्रजापतेर्थत्सहजं पुरस्तात्।

The mantra is not to be found in any of the existing Sanhitâs, but is given in the Brahmopanishad and by Baudhâyana. This verse is strikingly similar to the verse quoted above from the Haoma Yasht. It says, "yajnopavîta is high and sacred; it was born with Prajâpati, of old." The word purastât corresponds with paurvanim in the Avesta verse and thus decides the question raised by Dr. Haug, while

यज्ञाख्यः परमात्मा य उच्यते चैव होतृभिः। उपवितं यतोस्येदं तस्माद्यज्ञोपवीतकम् ॥

† See Tārānātha's Vāshaspatya s. v. upavīta; and Sānkhyā-yana Grihyasutra, ii. 2. 3, where the mantra is given as follows:— यज्ञीपवीतमासि । यज्ञस्य त्वा यज्ञीपवीतेनोपनद्यामि । In the Pāraskara Grihyastura, ii. 2. 11, both these mantras, यज्ञोपवीतं प्रमं & c., and यज्ञ्य त्वा &c., are given.

^{*} पारिजाते स्मृतिसारे:---

sahaja, born with the limbs of Prajapati, conveys the same meaning as mainvu-tástem. The coincidence between these verses cannot be accidental, and it appears to me that the sacred thread must be derived from the belt of Orion. Upavita, from ve to weave, literally means a piece of cloth and not a thread.† It appears, therefore, that a cloth worn round the waist was the primitive form of yajnopavita, and that the idea of sacredness was introduced by the theory that it was to be a symbolic representation of Prajapati's waist-cloth or belt. In the Taittirîya Sanhitâ (ii. 5. 11. 1.) nivîta, práchinâvîta and upavita, three words which at present denote the position of the sacred thread on the body of a Brâhman, are defined, but the Mimansakas! understand them to apply not to the sacred thread, as we now wear it, but to a piece of cloth or dear-skin, which everyone must use at the time of sacrificing. It appears, therefore, that in the oldest times the Brâhamans wore a piece of cloth or deer-skin and not a thread. This conclusion is further strengthened by the fact, that according to the ritual given in the Sûtras, no sacred thread is mentioned in the description of the ceremony of Upanayana; § while the investiture with the

the Cf. Jaiminîya nyâya mâlâ vistâra, iii. 4. 1. अत्र प्रतीयमानं निवीतादिकं वासोविषयं। न त्रिवृत्स्त्रविषयं। "अजिनं वासो वा दक्षिणतः उपवीय"
(Taitt. Arn., ii. 1) इत्यनेन सदशत्वात्। वस्य च निवीतं सीक्याय प्राप्तम्।
Taitt. Arn. ii. 1 is the only passage in the Vedic works which
fully describes the positions निवीतं &c., and it expressly mentions
वास and अजिन, but not सूत्र.

[§] See Târânâtha's Vâchaspatya s. v. upavîta. Also Ashvalâyana Grihya Sutra i. 19, 8-10-12, where ajina, mekhalâ and danda are alone mentioned.

thread is looked upon at present as the principal part of that ceremony. We have still retained a memory of this old practice in the performance of obsequies and at the time of performing sacrifices, when a piece of cloth is worn in addition to the sacred thread. Devala says that out of the three sacred threads to be worn, one is a substitute for the upper garment, thus clearly indicating what the old practice was. But this is not the place to go into these details. It is enough for our purpose to notice that yajnopavîta originally, meant a piece of cloth, and that in the times of the smritiwriters, it came to be symbolically represented by the sacred thread, thrice twisted and thrice folded. There is, however, another difficulty which must be here noticed. The Parsis wear their sacred thread round the waist, while the Brahmans usually wear it over the left shoulder and across the body, leaving the right arm free (i e., upavita). The Parsis may thus be said to wear their sacred thread after the manner of Orion; but in the case of the Biahmans, it may be questioned if their manner of wearing the thread corresponds to the position of Orion's belt. From the passage in the Taittiriya Sanhitâ referred to above, it will, however, be seen that nivita (and not upâvîta), is the position of the thread there prescribed for all human actions, or, in other words, for doing all ordinary business of life. Nivîta has been defined by all later writers to mean the position of the sacred thread passing around the neck, over both the shoulders and dropping down in front. A reference to Kumârila Bhatta's Tansa Vârtika (iii. 4. 2.), will, however, show that nivîta also meant "tying round the waist," and Kumarila observes that "tying round the waist is the most convenient position for all kinds of

^{*} मृतीयमुत्तरीयार्थं वस्त्राभावे तदिष्यते।

work."* Ânandagiri and Govindânanda in their commentaries on Shankara's Bhâṣhya on the Brahmasûtras (iii. 4. 19.), give the same explanation, from which it appears that the Brâhmans, like the Parsis, once wore the thread around the waist, thus literally girding up their loins when they had to do any work. The sacred thread of the Parsis and the Brâhmans thus seems to be a symbolical representation of Prajâpati's girdle or Orion's belt in every respect. The various stages, by which the original piece of cloth round the waist dwindled into a thread, are interesting and instructive from a ceremonial point of view, but not being relevant to the present inquiry, I do not mention them here.

निवीतं केचिद्रलेविषकांबंधं स्मरंति। केचित्युनः परिकरबंधं। तत्र गलविणकांबंधो युद्धादन्यत्र न प्राप्तोति। परिकरबंधस्तु सर्वकर्मस्वव्ययताकरत्वात्प्राप्त इति।

The word समरात in this passage indicates that the writer had a स्मात text in his mind. Mâdhava in his commentary on the Parûshara Smriti (Cal. Ed., p. 450) quotes Kâtyâyana and Devala as follows:—

कात्यायन:—पृष्ठवंशे च नाभ्यां च यधूतं विदते किटम्।
तद्धार्यमुपवीतं स्याञ्चातिलबं न चैव्लितम्॥
देवल—स्तनादूर्ध्वमधो नाभेः नैव धार्य कदाचन।

I think these verses clearly indicate that the thread must be worn below the breast and above the navel, and going round the whole waist. As the practice has long since been obsolete, the verses have been much misunderstood by later writers. The author of the waist does, however, clearly state that there are two ways of wearing the thread, first over the shoulder as described in the Taitt. Arn. ii. 1; and (यहा in the original) second as given in the above texts of Kâtyayana and Devala. This view has also been adopted by the author of the HERRICH.

^{*} As the passage is important as a record of now obsolete practice I give it here in the original—

But the sacred thread is not the only trace of Orion's dress that we have retained. A reference to the Upanayana ceremonial will show that we have preserved belt, staff, skin, and all. Every boy, who is the subject of this ceremony, has to wear a mekhalfi or grass cord round his waist, and we still put three knots to this cord just over the navel, as it were, to represent the three stars in the belt of Orion. In the Vâjasaneyi Sanhitâ 4. 10, we are told that the knot of the mekhalâ, when it is worn for sacrificial purposes, is to be tied with the mantra, "you are the knot of Soma,"t which Mahidhara explains as "a knot dear to Soma;" but which remembering that we have a similar verse in the Haoma Yasht, may be naturally interpreted to mean the knot of Soma, the presiding deity over the constellation of Orion. Then every boy whose upauayana, or the thread ceremony as it is popularly understood, is performed, must carry with him a stick of the palasha or the fig-tree and the same passage in the Vajasaneyi Sanhita says that for sacrificial purposes the stick (danda) is to be taken in hand by the Mantra, "O wood! be erect and protect me from sin till the end of this yajna." Here again Mahîdhara interprets yajna to mean sacrifice for which the staff is taken up.

मेखलां त्रिरावर्स नाभिप्रदेशे ग्रीयत्रयं कुर्थात्।

In the Sankhyayna Grihya Sutra ii. 2. 2, we are told that the knots of the mekhald may be one, three or five, and the commentator adds that the knots should be equal in number to one's pravaras. The author of the Sanskara Kaustubha quotes a smriti to the same effect. But the explanation is unsuited to the first case, viz., of one knot, and I am inc'ined to take it to be a later suggestion.

† सोमस्य नीविरसि ।

^{*} In the Prayoga works we have (and we still do so):-

But I think here also we may trace a reference to Prajâpati alias Yajna. The third accompaniment of a newly initiated boy is the deer-skin. Theoretically it is necessary that he should be fully clothed in a deer-skin, but practically we now attach a small piece of deer-skin to a silk thread and wear this thread along with the Yajnopavîta. Mekhalâ, ajina, danda (the girdle, the skin and the staff) are thus the three distinguishing marks of a newly initiated boy; and what could they mean, except that the boy is made to assume the dress of Prajâpati as far as possible. To become a Brâhman is to imitate Prajâpati, the first of the Brâhmans. Prajâpati assumed the form of a deer, so the boy is clothed in a deer-skin; Prajâpati has a girdle round his waist (the belt of Orion), so has the boy his mekhalâ with three knots over the navel; and lastly, Prajâpati has a staff, and so the boy must have it too.

^{*} Dr. Schrader in his Preh. Ant. Ary. Peop., Part iv., Chap. viii., concludes that the primitive dress consisted of a piece of woolen or linen cloth thrown round the shoulders like a mantle, and a girdle. The history of yajnopavita, the way of wearing it as described in Taitt. Arn. ii. 1., and Orion's dress, as conceived by the Greeks, point to the same conclusion. I have already alluded to the difficulty of explaining how uparîta, which literally means a cloth, came to denote a thread. If yajnopavîta be taken to have originally meant yajna and upavîta, and yajna be jurther supposed to have once denoted a girdle this difficulty is removed. Av. yasto Gk. zostos, Lith. justas, meaning "girded" point to an original root jos, Av. yangh, from which Gk zonu. Av. aiv yaonghana may be derived (See Ficks' Indo Germ. Wort). If we suppose that the root appeared as yaj in Sanskrit and derive yajna from it, like Gk. zonu, we may take yajna to mean a girdle and translate अयज्ञापनीती क्यं ब्राह्मण: (Jâbâl. Upa. 5.) by "how can a Brâman be without a girdle and a cloth.?" If this suggestion be correct, then yajnopavita must be

Thus in their Upanayan ceremony the Brahmans have fully preserved the original characteristic of the dress of Prajapati or Orion. The Brâhman batu (boy) does not, however, carry a sword as Orion is supposed to do, and the skin used by the boy is deer's and not lion's. I cannot account for the first of these differences except on the ground that it might be a later addition to the equipment of Orion, the hunter. But the second might be traced to a mistake similar to that committed in the case of the seven rikshas. The word Mriga in the Rigveda, means according to the Sâyana both a lion and a deer, and I have already referred to the doubts entertained by modern scholars as to the animal really denoted by it. Mrigajina is therefore likely to be mistaken for lions skin. There is thus an almost complete coincidence of form between Orion as figured by the Greeks and the boy whose upanayana is recently performed, and who is thus made to dress after the manner of Prajapati. I do not mean to say that a piece of cloth was not worn round the waist before the constellation of Orion was so conceived; on the contrary, it is more natural to suppose that the ancient

taken to have meant nothing more than a mantle and a girdle in primitive times and that the primitive people invested Orion with a dress similar to their own. When Orion came to be looked upon as a celestial representation of Prajapati, Orion's dress must have attained the sacred character which we find preserved in the sacred thread of the Parsis and the Bramans. I, however, know of no passage in the Vedic literature where yajna is used in the sense of a girdle, and hence the above suggestion must be considered as very doubtful. But it may be here mentioned that in Marathi we use the word janve to denote the sacred thread. This word is evidently derived from Sk. yājna, Prakrita janno. Perhaps we have retained only the first word of the long compound yajnopavita.

people invested Orion with their own dress. But the coincidence of details above given does, in my opinion, fully establish the fact that the sacred character of a batu's dress was derived from what the ancient priests conceived to be the dress of Prajapati. With these coincidences of details, still preserved, it is impossible to deny that the configuration of the constellation of Orion, is of Aryan origin and that the Hellenic, the Iranian and the Indian Aryas must have lived together when these traditions and legends were formed.

And now it may be asked that if the Eastern and the Western legends and traditions of Orion are so strikingly similar, if not identical, if the dress and the form of the constellation are shewn to have been the same amongst the different sections of the Aryan race, and if the constellations at the feet and in front of Orion-Canis Major and Canis Minor, Kuon and Prokuon,* Shvan and Prashvan, the Dog ndthe Foredog-are Aryan both in name and traditions; in short, if the figure, the costume, the attendants and the history of Orion are already recognised as Aryan is it not highly probable that the name, Orion, should itself be a transformation or corruption of an ancient Aryan word? Orion is an old Greek name. Homer in the fifth book of Odyssey speaks of the bold Orion and the traditional coincidences, mentioned above, fully establish the probability of Plutarch's statement that the word is not borrowed from a non-Aryan source. Two of the three names, mentioned by Piutarch Canis (Kuon) and Ursa (Arktos) have again been phonetically identified with Sanskrit shvan and rikshas, and we may, therefore, legitimately expect to find Orion similarly traced back to an Aryan original. The task, how-

^{*} See note on page 119 supra.

ever, is not so easy as it appears to be at the first sight. The Greek mythology does not give us any help in the solution of this question. It tells us that a hunter by name Orion was transformed after his death into this constellation which consequently came to be called after him. But this is surely no satisfactory explanation Who is the hunter that was so transformed? There are many mythological proper names in Greek which can be traced back to their Aryan originals, and why should Orion be not similarly derived? The story obviously points to the Vedic legends of Rudra, who is said to be still chasing Prajapati in the heavens. The Vedic legend has fully preserved all the three elements in the story—the hunter Rudra, the dog and the antelope's head, while the Greeks appear to have retained only the hunter and the dog with nothing to hunt I But that does not preclude us from discovering the identity of these legends and the question is whether we can suggest a Sanskrit word which will give us Orion according to the already established phonetic rules. I know of no name of Rudra from which Orion can be so derived. But if we look to the names of the constellation of Mrigashiras, we may, I think, in the absence of any better suggestion provisionally derive Orion from Sanskrit Agayana the original of Agrahavana; The intial long a in Sanskrit may be represented by omega in Greek as in Sk. âma, Gk. ōmos, Sk. âshu, Gr. bkus, and the last word ayana may become ion in Greek. It is not, however, so easy to account for the dropping of g before r in the body of the word. Comparison of Sk. gravan which Gk. laos and of Sk. ghrana with Gk. ris, rinos, shews that the change may take place initially, but scholars whom I have consulted think that there is no instance in which it takes place medially

between Greek and Sanskrit, though such changes are not rare between other languages as in Old Irish ar, Cymric ear, which K Brugmann I derives from agra. Also compare Gk. dakru, Goth. tagr. Old Irish der, English tear; Latin exagmen, examen, O Ir. am, from the root aj. I do not feel myself competent to decide the question, and hence must remain content with simply throwing out the suggestion for what it is worth. I have shewn that traditional coincidences clearly establish the possibility of the Aryan origin of Orion, and if I have not hit upon the correct word that does not affect my argument. My case does not, in fact, rest on phonetic coincidences. I rely principally upon certain statements in the Vedic works, which indicate that the vernal equinox was once in Orion, and I wanted to shew—and I think I have shewn it—that there is sufficient evidence in the Greek and Parsi legends to corroborate the statment in the Vedic works about the Phalguni full-moon being once the first night of the year. We can now give a reasonable explanation of how Fravarshinam came to be the first month in the primitive Parsi calendar and why Dathusho should have been dedicated to Din (creator) †

Comp. Gram., Vol. I. Arts. 518, 523. Prof. Max Muller extends the rule to Greek and Latin, see his Lectures on the Science of Language, Vol. II., p. 309, where several other instances are given. For a full statement of the phonetic difficulties in identifying Gk. Orion with Sk. Agrayana, see App. to this essay.

better account for the names Ahuramazda and Ahriman on the theory that the vernal equinox was then in Orion, the winter solstice in Utterâ Bhâdrapadâ and the summer solstice in Uttarâ Phalguai. The presiding deities of the last two Nakshatras are respectively Ahir-Budhnya and Aryaman. According to the Avesta belief, which assigns the south to the Gods and the north to the Daevas, Ahir Budhnya, as the regent of the southermost

The mummeries and festivals amongst the Germans can also be more satisfactorily accounted for, while above all, the form the dress and the traditions of Orion may be now better traced and understood. I have already in the previous chapter shown that even the Vedic legends, especially those in the later works, can be simply and naturally explained on the assumption we have made regarding the position of the equinoxes in the days of the Rigveda. The hypothesis on which so many facts, legends, and traditions can be so naturally explained, may, in the absence of a better theory, be fairly accepted, as correct without more proof. But in the present case we can go still further and adduce even direct evidence, or express Vedic texts, in its

point, would come to be regarded as the supreme ruler of the gods, while Aryaman would be the king of the evil spirits. Therefore we may suppose that the names Ahura Mazda and Ahriman, if not actually derived from these words, were, at least modelled after them. Amongst the names of the Vedic deities Ahir Budhnya is the only word, both the component members of which, are declined as in Ahura Mazda. Spent Mainyus and Anghra-Mainyus is a distinct pair by itself; and besides the difficulty of deriving Ahriman from Anghra Mainyus, there seems to be no reason why Abriman, if so derived, should be contrasted with Ahura Mazda. (See Fhil. Mazd. Relig. by Casartelli, trans. by F. J. Dastur Jamasp Asa, §§ 71, 72, pp. 54-6.) Parsi mythology has another deity named Airyaman, and as this word is derived from Sanskrit Aryaman, it may be objected that same word cannot be said to have also given the name for the evil spirit. I do not think that the objection is well founded. Cf. Andra (Sk. Indra and Verethraghna (Sk. Vritrahan) both of which are the names of the same deity in Sanskrit, but one of which has become an evil spirit in the Avesta. But I cannot fully discuss the subject in a note, and not being pertinent to my case, I cannot also do more than merely record here an explanation that may possibly be suggested.

support. In the chapter on the Krittikas, I have drawn attention to the remarks of Prof. Max Müller who objected to the conclusion based entirely on the Vedanga Jyotisha on the ground that no allusion to the position of the Krittikas was to be found in the Vedic hymns. We can now account for this silence; for how can the hymns, which appear to be sung when the sun was in Orion at the beginning of the year, contain any allusion to the period when the vernal equinox fell in the Krittikas? This could have been easily perceived if, instead of confining to the controversy about the position of the Krittikas and endeavouring to find out if some clue to the date of the Veda could be obtained from the determination of the original number and source of the Nakshatras, scholars had pushed their inquiries further back and examined the Vedic hymns in the same critical spirit. It would not have been difficult in that case to discover the real meaning of the Vedic verse which states that "the dog awakened the Ribhus at the end of the year." I have in a previous chapter already referred to the verses in the Rigveda regarding the position of Yama's dogs and the death of Namuchi. These passages, as well as the description of Vrika or the dog-star rising before the sun after crossing the eternal waters, the terminus of the Devayana (Rig. i. 105. 11.), sufficiently indicate the position of the equinoxes in those days. In the next chapter I propose to discuss and examine two other important passages from the Rigveda, which directly bear out the statement in the Taittirya Sanhità with which we have started, viz., that the Phalguni full-moon commenced the year at the winter solstice in days previous to those of the Tailtîry; Sanhità and the Brahmans.

CHAPTER VII.

RIBHUS AND VRISHAKAPI.

Knowledge of astronomy in Vedic times—The seasons and the year— The ayanas—The zodiacal belt or rita—Observation of a tota eclipse of the sun in the Rigveda-Knowledge of the planets-Shukra and Manthin-Venus and Vena, Shukra and Kupris-The legend of the Ribhus-Their identification with the Ritus of the seasons of the year—Their sleep or rest in Agohya's (sun's house for 12 intercalary days - said to be awakened by dog (Rig i. 161. 13) at the end of the year-Indicates the commencemen of the year with the dog-star-Nature and character o Vrishâkapi-His identification with the sun at the autumna equinox-The hymn of Vrishâkapi in the Rigveda x. 80-It Meaning discussed verse by verse-Cessation and commence ment of sacrifices on the appearance and disappearance o Vrisbâkapi in the form of a Mriga-Indranî euts off his head and sets a dog at his ear-Orion (Mrigashiras) and Canis-Meaning of nediyas in the Vedic literature—When Vrishakapi enters th house of Indra, his Mriga becomes invisible (Rig x. 86. 22.)-Points to the vernal equinox in Orion or Mriga-Leading inc. dents in the story stated and explained.

It is said that we cannot suppose that the Vedic bard were acquainted even with the simplest motions of heavenly bodies. The statement, however, is too general and vague to be criticised and examined. If it is intended to be understood in the sense that the complex machinery conservation which the modern astronomers possess and the results which they have obtained thereby were unknown it early days, then I think there cannot be two opinions of that point. But if by it is meant that the Vedic poets were ignorant of everything except the sun and the dawn ignorant of the Nakshatras, ignorant of month, ayanas years and so on, then there is no authority or support for such a supposition in the Rigveda. On the contrary, we

find that some of the Nakshatras are specifically named, such as Arjunî and Aghâ in Rig. x. 85. 13, while the same hymn speaks generally of the Nakhatras, and the motions of the moon and the sun as causing the seasons. In Rig. i. 164 we have again several references to the seasons, the year and the number of days contained in it (verse 48) and according to Yaska, perhaps to the avanas (Nirukta 7. 24). I have in a previous chapter referred to the passages in the Rigveda, which mention the Devayana and the Pitriyana, the old names of the ayanas beginning with the vernal equinox; and there is, therefore, no objection to understand the above verse (i. 164. 48) as alluding to the black or the Pitriyana. The intercalary month is mentioned in Rig. i 25. 8. while in i. 24.8 Varuna is said to have constructed a broad path for the sun, which appears evidently to refer to the Zodiacal belt. I am further inclined to think that the path of rita (Rig. i. 41. 4) which is mentioned several times in the Rigveda, where the Adityas are said to be placed (x. 85. 1), and wherein Sarama discovered the cows of Indra (v. 45.7, 8) refers to the same broad belt of the Zodiac which the luminaries, as observed by the Vedic bards, never transgressed. It was so to speak their 'right' way, and therefore called rita, which though literally derived from rito go, soon came to mean the 'right,' path the circle of which exists for ever, or rather exists and exists (varvarti) in the vault of the heavens (Rig. 1. 164. 11). Prof. Ludwig goes further and holds that the Rigveda mentions the inclination of the ecliptic with the equator (i. 110. 2) and the axis of the earth (x. 89. 4). It is now generally admitted that the seven rikshas were also known and named at this time. The mention of a hundred physicians in Rig. i. 24. 9 may again be taken'

to represent the asterism of Shata-bhishak or Shatatârakâ, presided over by Varuna according to the later lists of the Nakshatras in the Taittirîya Brâhmana. The fortieth hymn in the fifth Mandala of the Rigveda is still more important in this connection. It shows that an eclipse of the sun was then first observed with any pretensions to accuracy by the sage Atri. It is thus that I understand the last verse in the hymn which, after describing the eclipse, says, "Atri alone knew him (the sun) none else could." This observation of the solar eclipse is noticed in the Sânkhyâyana (24. 3) and also in the Tândya Brâhmana (iv. 5. 2; 6. 14), in the former of which it is said to have occurred three days previous to the Vishûvân (the autumnal equinox). The observation thus appears to have attracted considerable attention in those days. It seems to have been a total eclipse of the sun, and the stars became visible during the time, for I so interpret the expression, bhuvanâni adîdhayuh in vefse 5. In verse 6 we are told

^{*} Prof. Ludwig has tried to deduce the date of the hymn from this circumstance. But the attempt is a failure as shewn by Prof. Whitney (see the Proceedings of the American Oriental Society, Vol. XIII. pp. 1722) As the eclipses recur in the same order after a certain period, we cannot use such facts for chronological purposes without knowing the geographical position of the place where the eclipse occurred, and even then the conclusion will be correct only if it can be shown on independent grounds that such a phenomenon did not occur at that place during several centuries before or after the date we determine. I, therefore, simply use the hymn for the purpose of showing that an eclipse of the sun was observed in those days in such a way as to leave a record behind. It would be difficult to deduce any other reliable conclusion from it even upon the assumption, not known and hence not used by Prof. Ludwig, that the vernal equinox was then in Orion and that the eclipse occurred three days before the auturnal equinox as described in the Brâhmanas. I cannot, however, accept the suggestion that the hymn may be understood as referning to the obscuration of the sun by clouds,

that "Atri knew (the eclipsed sun) by turiya brahma," and Sâyana interprets the last two words to mean "the fourth verse or mantra." But the verse wherein these words occur is itself the sixth, and Sayana has to explain that by "fourth" is to be understood the "fourth, if we count from the sixth, i. e, the tenth verse!" The explanation may be good from the ritualistic point of view, but it appears to me to be quite unsatisfactory otherwise. I would rather interpret turîyena brahmanâ to mean "by means of turiya." Turîya is mentioned in modern astronomical works as a name for an instrument called quadrant (Siddhanta Shiromani x. 15), and though we may not suppose the same instrument to have existed in the old Vedic days, yet there seems to be no objection to hold that it may have meant some instrument of observation. The word brahma is no doubt used to denote a mantra, but it may also mean knowledge or the means of acquiring such knowledge. In Rig. ii. 2.7 Sâyana has himself interpreted brahma to mean some "act or action;" and I see no reason why we should not understand the phrase turiyena brahmanâ in the above hymn to mean "by the action of turiya," or, in other words, "by means of turiya," and thus give to the whole hymn a simple and natural appearance, rather than endeavour to interpret it after the manner of the Red Indians, who believed that Columbus averted the calamity of the eclipse by prayers. The peasants of the Vedic times, some scholars might argue, cannot be considered to be more civilized than the Red Indians; but in so arguing they forget the fact that there must be a Columbus, who would, by his superior capacity, inspire the feelings of awe and reverence for him. When the bards, therefore, tell us that Atri knew of the eclipse by turiya brahma, we can now easily see what it means.

Sâyana's explanation, as I have above observed, may be good from the ritualistic standpoint; but we cannot, for other purposes, accept an interpretation which makes the 'fourth' to mean the 'tenth' verse of the hymn! Thus understood the hymn clearly indicates that at the time when the observation was taken the Vedic priests were tolerably well acquainted with the elementary astronomical facts. It is, however, suggested that the planets were unknown in these days. I am unable to accept even this statement. It is impossible to suppose that the Vedic poets, who constantly watched and observed the various Nakshatras in the Zodiac. should not have noticed planets like Venus, Jupiter, or Saturn, which outshine many of the Nakshatras in brilliancy. The periodical appearance of Venus in the west and the east, and especially its rising only to a certain altitude followed by its regress, are facts too striking to remain unnoticed even by the superficial observers of the heaven. But we must not go on mere probabilities. The hymns of the Rigveda are before us, and though probabilities may serve the purpose of determining the direction of our search, yet if we cannot find any reference to the planets in the Vedic works themselves we must give up the notion that they were known to the poets of these hymns. There is no question that planets were known in the days of the Brahmanas. In the Taittiriya Brahmana (iii. 1. 1. 5) we are told that Brihaspati (Jupiter) was first born near the asterism of Tishya, and to this day the conjunction of Tishya and Jupiter is considered as highly auspicious in the astrological works. We have, how-

^{*} बृहस्पति: प्रथमं जायमान: तिष्यं नक्षत्रं प्रादुर्वभूव | This reminds us of Rig. iv. 50. 4, where similar wording occurs, thus:— वृहस्पति: प्रथमं जायमानोमहो ज्योतिष: परमे ब्योमन् ।

ever, to look for any allusion to the planets in the Rigveda itself. The mention of the five bulls in Rig. i. 105. 10 may not be considered as sufficiently explicit to denote the five planets; but what shall we say to the mention of Shukra and Manthin together in Rig. iii, 32, 2 and ix, 46, 4? They seem to be evident references to the vessels called Shukra and Manthin used in sacrifices and have been so interpreted by the commentators. But as I have before observed, the vessels in the sacrifice themselves appear to have derived their names from the heavenly bodies and deities known at the time. It is generally conceded that the sacrificial arrangements more or less represent the motions of the sunt and the chief events of the year. In other words, the yearly sacrifice is nothing but a symbolical representation or rather imitation of the sun's yearly course. If so, it is natural to suppose that some of the sacrificial vessels at least were named after the Nakshatras and the planets. In the Taittiriya Sanhita iii 1.6.3. the vessels are spoken of as 'the vessels of Shukra,' 'the vessels of Manthin,' and so on, which indicates that Shukra and Manthin were not used as adjectives of the vessels. The only other explanation is to suppose that Shukra, Manthin, Agrayana, &c, were the names of Soma juice, and that the vessels used for holding that juice in its various capacities, were described as the vessels of Shukra, &c. There is, however, no authority in the sacrificial literature for holding that Soma really had so many and such different capacities: and I therefore

^{*} Cf. Rig. 1, 162, 18:x, 55. 8. Also see Kaegi's Rigveda (translated by Arrowsmith), p. 20, and note 67 on page 115. I hold that the planets were not only known, but some of them at least had already received their names by this time.

[†] See Dr. Haug's Intr. Ait. Br., p. 46.

conclude that the mention of Shukra and Manthin, as applied to vessels, in the Rigveda is a clear indication of the planets being then discovered. There is, however, in my opinion, a more explicit reference to a planet in the Rigveda which does not seem to have yet been noticed. In the tenth Mandala we have a hymn (123) dedicated to Vena which according to Yaska denotes a deity of the middle region. Yaska (Nirukta 10.38) derives the word from ven 'to love,' 'to desire,' and explains it as denoting, as his commentator Durgâchârya says, "loved by all;" while the hymn itself contains such expressions as the "son of the sun," "on the top of rita," "comes out of the ocean like a wave," † &c., which have been variously interpreted by the commentators. But from all these facts I think we have herein the original Aryan name of Venus. The word, or rather the meaning I have here proposed, is entirely lost in the Sanskrit literature, but considering the fact that the Latins named the planet as Venus, while the word cannot be satisfactorily derived from any Latin root, I there can be no objection to identify Venus with the Vena (nom. sin. Venas) in the Vedic works. In the Latin mythology Venus is the goddess of love, and this we can now easily account for, as the name of the Vedic deity is derived from a root which means "to desire," "to love." I may again point out that the hymn of Vena in the Rigveda, is used in sacrifices at the time, when the priest

See Mahidhara on Vaj. San. 7. 16. Some consider that the root is Vin and not Ven.

[†] This reminds one of the tradition of Aphrodite who, in Greek mythology, is said to be sprung from the foam of the sea.

In Dr White's Latin English Dictionary the word is derived from Sanskrit van to love; but if it is to be derived from a Sanskrit root why not derive it from vin or ven to desire or love, and so connect it with Vena of the Rigveda.

takes up the vessel Shukra in the sacrificial ceremonies.* Kâtyâyana, indeed, mentions the optional use of the hymn for taking up the vessel of Manthin.† But that does not much alter the position, for, when the meaning of the word was utterly forgotten the hymn might come to be used for a different purpose in addition to the previous one. The fact, that the Vena hymn was used in taking up the Shukra vessel is, therefore, an important indication of its old meaning, and when we find the name actually preserved till now indicating the planet Venus, and that this name cannot be satisfactorily derived in any other way, we might fairly infer that Vena of the Rigveda is Venus of the Latin mythology. As regards the change of gender we need not consider it to be a serious objection inasmuch as not only Venus, but also the moon has changed in gender in its passage to Europe. As a further proof of the statement that the planets, or at any rate Shukra, was discovered and named in the primitive period, I refer to the Greek word Kupris (Latin Cypris) which means Venus. The word can be easily identified with Sanskrit Shukra which, according to the well-established phonetic rules, becomes Kupros in Greek, the initial sh being changed to k, as in Sk. shvan, Gk kuon and the medial kr to pr by labialisation, cf. Gk.

^{*} See Durgacharya on Nirukta 10. 39, शुक्रो प्रहोऽनया गृद्यते.

[†] The Sutras of Katyayana bearing on this point are as follows:-(See Kat, Shr. Su. ix. 6. 11—13) गुरु बेल्वेन वा तं प्रतिशित । अयं वेन
इस्पेके | मंथिनसयं वेन इति | . Thus he first lays down that the
Shukra vessel be taken by reciting the hymn तं प्रतिशा &c. (Vaj San.
7. 12) or according to some the hymn अयं वेन: &c. (Vaj. San 7. 16.
Rig x. 123). He then observes that this latter hymn is used in taking
up the Manthin vessel.

priamai, Sk. krî-nami, I purchase. As Venus was supposed to be a feminine deity in Europe Kupros was naturally changed into Rupris. Thus, both the Latin and the Greek names of the deity may be traced back to the Vedic Vena and Shukra, and we may therefore hold that the planet was discovered and named before these races separated. I know that European lexicologists derive Kupris from Kupros the Greek name of the island of Cyprus where Venus was said to be much worshipped and that Cyprus again is supposed to have received its name from the trees, cypresses, in which it abounds! But the explanation, which gives no derivation for the name of the tree, seems to me to be quite unsatisfactory. If Aphrodite was known to the Greeks in the primitive times it is more natural to derive the name of the island from the name of the deity. In course of time this original connection between the name of the deity and that of the island may have been forgotten, and Greek writers regarded Kupris as born in Cyprus. But we must receive these derivations of Greek mythological proper names with great caution as most them have been suggested at a time when comparative Philology and comparative Mythology were unknown. Latin cuprum meaning 'copper' is again said to be derived from Cyprus (Gk. Kupros), but it does not affect our argument, for whatever be the reason for giving the name to the island, once it was named Cyprus or Kupros, many other words may be derived from it without any reference to the reasons for which the island was so called.

Some of the reasons given above may be doubtful, but on the whole I am inclined to hold that the Vedic Rishis were not as ignorant of the broad astronomical facts as they are sometimes represented to be. They seem to have watched

and observed the sun and the moon during their yearly course, noted the bearing of the motions on the division of time, fixed the length of the solar year and endeavoured to make the lunar correspond with it. The Nakshatras and their rising and setting also appear to have been duly observed. It was perceived that the sun and the moon and such of the planets as they had discovered never travelled out of a certain belt in the heavens, called rita; while the eclipses of the sun and the moon also received due attention and notice. Men, who were acquainted with these facts, would naturally be able to fix the beginning of the months and the year by the stars that rose at the time, and though we cannot suppose the Vedic bards to have been in the possession of any accurate astronomical instruments, yet it was not difficult for them to decide roughly by simple observation when the day and the night were equal, or when the sun turned to the north, either from the solstitial or from the equinoctial point. The knowledge implied by these observations may appear to be too much for a Vedic poet in the opinion of those who have formed their notions of primitive humanity from the accounts of savages in Africa or the Islands of the Pacific. But as observed before we must give up these a priori notions of primitive humanity in the face of evidence supplied by the hymns of the Rigveda. It is on this evidence that we have to form our judgment of the primitive Aryan civilization, and if that evidence is found conflicting with our prepossessions, the latter must be given up. In what follows I shall therefore assume the capacity of a Vedic bard to make the simple observations above mentioned.

We shall now take up the verse in the Rigveda, referred to several times previously, the verse, which declares that a dog awakened the Ribhus at the end of the year. (Rig.

i. 161. 13); and the first question that arises in this connection is, who are the Ribhus? Referring to Nirukta (11. 15 and 16) we find that native scholars consider that the three Ribhus-Ribhu, Vibhvan and Vaja-were the sons of Sudhanvan and that having rendered wonderous services to the Gods they gained divine honors and a share in the sacrifice and immortality.* But even Yaska does not seem to be satisfied with this explanation. There are several hymns in the Rigveda wherein the deeds of the Ribhus are described (Rig. iv. 33-37; i. 20. 110. 111 and 161), and in most of them the Ribhus are spoken of as working in close connection with the year (samvatsam or samvatsara). Thus in the Rigveda i. 110. 1. they are said to have commenced work at the end of the year, and in iv. 33. 4. they are described as engaged, for the whole year (samuatsam), in reviving the cows (the rays of the sun). The Ribhus are further mentioned as resting in the house of Agohya, the "unconcealable" sun-god for twelve days at the end of their course (Rig. iv. 33.7). In Ait. Br. iii. 30 they are described as sun's neighbours or pupils (ante vásás); while in Rig. iv. 51. 6 their work is said to be done by the dawn. Yaska therefore considers that the Ribhus also represented the rays of the sun, and in this he is followed by Sâyana. But the explanation does not account for the number of the Ribhus who are said to be three brothers. We must therefore go a step further and hold that the Ribhus did not merely represent the rays of the sun generally, but the three seasons, as connected with them, as several European scholars have suggested.† In the Rigveda iv. 34. 2, the

^{*} Also compare Brihad-devatâ iii. 81, 88; p. 82, Cal. Ed., where the same story is given.

[†] See Kaegi's Rigveda, p. 37, and note 127 on page 133. Particularly see Ludwig's Rig. iii., pp. 1879.

Ribhus are told to rejoice with the seasons (Ritus) and this supports the latter view. In Rig. i. 15. 10, Dravinoda is said to be the fourth companion of the seasons and the Shatapatha Brâhmana (xiv. 1. 1. 28) expressly states that there are three seasons. It is therefore generally believed that this was the old division of the year, and that the number of the seasons was increased as the Aryas travelled further from their original home. The three Ribhus, representing the three seasons, may thus be said to be engaged, throughout the whole year, in doing wonders for the gods and received as guests in the house of Agohya at the end of their course. "Here they spend twelve days in enjoyment; then the course begins anew, and anew the earth brings forth fruit, the streams flow; plants cover the heights, and waters the depths."† And now comes the verse (Rig. i. 161. 13) on which I rely:-

सुषुप्वांसं ऋभवस्तदेपृच्छतागोद्धा क द्दं नो अबूबुधत्। श्रानं बस्तो बोधियतारमबबीस्तवःसर इदमुद्या व्यंस्यत ॥

Here the Ribhus, awakened from their sleep and rest for twelve days, ask "Agohya! Who is it that awakened us?" The goat (the sun) replies that it is the "hound." Sâyana understands shvûnam to mean 'wind,' but there is no authority for it and the meaning is perfectly unnatural. In fact Sâyana may be said to have failed to interpret the

^{*} Kaegi's Rigveda, p. 116, note 68, where he quotes Zimmer to the same effect.

[†] This is in substance a translation of Rig. i. 161. 11 and iv. 33. 4. See Kaegi's Rigveda, p 37.

Idam in the first line is not the object of abithudicat as Eayana and Mr. S. P. Pandit suppose. It should be taken either in apposition with tat, or as an adverb meaning 'now,' here,' &c.

verse correctly. Ludwig and Grassmann both translate it by 'hound,' but neither of them explains what it signifies. There is again some difference of opinion as to whether the word samvatsare should be taken with bodhayitaram or with vyakhyata. But which so ever construction we adopt the meaning remains the same, since it is the same thing if the Ribhus are said to be awakened at the end of the year and then commenced their course, or they awakened and then looked up at the beginning of the new year, or in other words, commenced their new-year's course. Practically, therefore, all agree in holding that the awakening of the Ribbus here referred to is their awakening at the end of the year, after they have enjoyed sound sleep and rest in the house of Agohya for twelve (intercalary) days, and the only question that remains is, who is the hound or the dog that awakens them? We have seen that the Ribhus were the genii of the seasons and that as companions of the sun they worked wonders during the whole course of the year. But as it was a lunar year, 12 days were intercalated at the end of each year to make it correspond with the solar year. These 12 days belonged neither to the old nor to the new year, and the Ribbus were therefore naturally believed to suspend work during this neutral period and spend it in rest and enjoyment in the house of Agohya. When the whole legend has thus a chronological signification it is natural to hold that the hound, here alluded to, must be some constellation in the heavens, and if so, after what has been said in the previous chapters about it, what could it be except Canis Major or the Dog-star? The end of the year here referred to is evidently the end of the three seasons, represented by the three Ribhus, and we must, therefore, take

it to mean the end of the equinoctial year or the beginning of Vasanta, the first of the seasons. Durgâcharya in his commentary on Nirukta 11. 16 explains the phrase samvaisare (in Rig. i. 110. 4) in the same way. As I have already discussed the subject before,* I do not here repeat the grounds on which I hold that the year, in primitive times commenced with the vernal equinox. Prof. Ludwig has made a happy suggestion that ûbhogaya, which the Ribbus are said to desire (Rig i. 110. 2) before they commence their career and reach the house of the sun, should be interpreted in its ordinary sense to mean the bend or the inclination of the ecliptic with the equator. Our investigation based upon independent facts leads us to the same conclusion. In short, the whole story of the Ribhus, as we find it recorded in the Rigveda, directly establishes the fact that at the time when this legend was formed the year commenced with the vernal equinox in Canis Major or the Dcg-star. It is highly improbable, if not impossible, to give any other reasonable interpretation to the verse in question, whether we understand the Ribhus to mean the three seasons of the year or the rays of the sun as Yaska and Sayana have done. With the vernal equinox near the Dog-star, the winter solstice would fall on the fullmoon in Phalguna and Mrigashiras would head the list of the Nakshatras. Our interpretation of the verse in question is, therefore, fully warranted by the traditions about the ancient year-beginnings given in the Taittiriva Sanhitâ and the Brahmanas.

Let us now examine the too much and too long misunderstood or rather not-understood hymn of Vrishâkapi in the tenth Mandala of the Rigveda. As there is only one

^{*} See supra, Chapter II.

hymn in the Rigveda which gives the story, it is not easy, as in the case of the Ribhus, to determine the nat of the deity, and hence various conjectures have been m by scholars as to its origin, character and meaning. 7 deities appear both in the masculine and in the femin form, Vrishâkapi and Vrishâkapâyî. Amara considers t Vrishâkapi means either Vishnu or Shiva, and Vrishâkap either Lakshmî or Gaurî. In the Brihad-devatâ Vrishâk is said to represent the setting sun, and Vrishakapâyî gloaming.† Yâska (12. 27) would derive the word so as mean the sun who shakes (the world) with his rays, and commentator observes that the god showers mist or dew shakes the animate world. Modern speculations about derivation and the meaning of the name may be found Phânu Dikshita's commentary on Amara (iii. 3. 1 Prof. Max Müller, in one place, f observes that "it difficult, on seeing the name of Vrishakapi, not to th

of Erikapaeos, an Orphic name of Protogonos and synonymous with Phanes, Helios, Priapos, Dionysos." but, says he, "the original conception of Vrishâkapi (Vrishan, bull, irrigator; Kapi, ape, tremulous) is not much clearer than that of Erikafaeos." However, if the comparison be correct, we may, I think, take it as confirming the identification of Vrishakapi with the sun proposed by several scholars, native and European. In fact, there seems to be a general agreement that Vrishakapi represents the sun in one form or the other. But this alone does not account for all the incidents recorded in the hymn. I would, therefore, further suggest that Vrishakapi be understood as representing the sun at the autumnal equinox, when he may be rightly said to shake off the rains, inasmuch as the equinox falls at the end of the rainy season. I have previously shown that the conception of Vishpu and Shiva can be traced to the Vedic Vishnu and Rudra, and these latter may be taken as the types or the embodiments of the mild and terrible aspects of nature at the vernal and the autumnal equinox. If Vrishakapi in later mythology has therefore come to denote Vishnu and Shiva, according to Amara, the meanings are consistent with the supposition that in the Vedas Vrisbakapi represents the sun at the equinoxes. In the hymn itself, Vrishâkapi is said to have assumed the form of a yellow antelope whose head Indrani is described to have cut off. This circumstance serves to guide us in at once fixing the position of Vrishakapi in the heavens. It is the same antelope's head that has given rise to so many myths. When the position of Vrishakapi is thus fixed, it would not be difficult to understand the various incidents described in the hymn. But without further anticipating what I have to say in the explanation of the hymn, I

now proceed to examine the hymn itself. We shall then see whether the assumption which we have made regarding the character and attributes of Vrishâkapi gives us a simple, natural, and above all, intelligible explanation of the story given in the hymn, which, as explained at present, is nothing but a bundle of disconnected, if not mutually inconsistent, statements. I shall first quote the original hymn.

वि हि सोतारस्थत नेंद्रं देवममंसत । यत्रासंदद्वाकिपर्यः नुष्टेषु मत्संखा विश्वसादिद्र उत्तरः ॥१॥ परा हींद्र धार्वास वृषाकपेरति ज्याथेः। नो अह प्र विद्ध्यन्यत्र सोमपीतये विश्व ।। २ ॥ किम्यं स्वां वृषाकि विश्वकार् हितो मृगः। यस्मा इरस्यसीदु नव यो वा पुष्टिमद्रसु विश्व०॥३॥ यमिमं खं वृषाकिपिं प्रियमिद्राभिरक्षास । भा न्वस्य जंभिषद्ि कर्णे वराह्युर्विश्व ।। ४ ॥ त्रिया तष्टानि मे किपव्यक्ता व्यव्दुष्वत् । शिरो न्वस्य राविषं न सुगं दुष्कृते भुवं विश्वं ।॥ ५॥ न मस्बी सुभसत्तरा न सुयाश्चितरा भुवत्। न मस्प्रतिच्यवीयसी न सक्थ्युर्धमीयसी विश्वं ।। ६॥ उवे अंब सुलाभिके यथेवांग भविष्याते । भन्समें अंब सिवध में शिरों में वीव हृष्यित विश्व ।। ७ ॥ कि सुबाहो स्वंगुरे पृथुष्टो पृथुजावने। कि शूरपितन नुस्त्वमभ्यमीषि वृषाकिप् विश्व ।। ८॥ अवीरामिव मामयं शरारुरिम मन्यते। उताहमसिम वीरिणींद्रपरनी मरुसिखा विश्व०॥ ९॥ संहोत्रं सम पुरा नारी समनं वार्व गच्छति ।

There are twenty-three verses in the hymn; and of these 3, 4, 5 and 20, 21 and 22 have a direct bearing on the question we are discussing. But to understand these verses properly, it is necessary to discuss most of the other verses in the hymn, and I shall the efore examine the hymn verse by verse. I have already remarked that the hymn is one of those which have not yet been properly understood. Some of the verses have been explained by Yaska, but he has nowhere tried to give us the bearing of the whole story described in the hymn. Sayana's commentary is very often simply verbal, and in many places he too is not certain about the meaning, while the Anukramani has been several times disregarded by Sâyana himself. On the other hand, Ludwig, Grassmann, and several other European scholars have tried in their own way to explain the legend or the story embodied in the hymn, and the latest attempt of the kind is that of Piscel and Geldner in their Vedic studies, Vol. VII., Part I. These scholars hold that the hymn narrates a legend current in old days. In other words, they take it, and I think rightly, to be a historic hymn. But the question, what does the legend signify, or how did it

^{*} I am indebted for this information to Dr. R. G. Bhândârkar, who kindly undertook to explain to me the views of German scholars on this point.

originate, still remains unsolved. Piscel and Geldner understand the hymn to mean that Vrishakapi went down to the south and again returned to the house of Indra. But even then the bearing of the legend is but imperfectly explained. The occurrence of such words as dâsa, ârya and parshu in the hymn have led some to suppose that the hymn records the story of a struggle between the Aryan and the non-Aryan races. But the hypothesis hardly explains the various incidents in the story, and the legend may therefore be said to be but still imperfectly understood. Under such circumstances any suggestion which explains the hymn better is at least entitled to a hearing. It is admitted that the hymn is a dialogue between Indra, Indrani, and Vrishakapi, a son of Indra as they call him,* But there is a great divergence of opinion in assigning different verses to their deities. I shall examine these points while discussing the verses.

^{*} Kâtyâyana in his Sarvânukramanî says— वि हिन्य धिकेंद्रो वृषाक-पिरिंद्राणींद्रश्च समृदिरे । Upon this the Vedârtha dîpikâ by Shadgurushishya has,—वृषाकिपनीमेंद्रस्य पुत्रः श्वाचीसपत्न्यां जातः इंद्राणींद्रपत्नींद्रश्च स्वयमिति त्रयः समृदिरे सहस्थेदिरे विवादं कृतवंतः । The verses of the hymn are then distributed amongst the speakers as follows:— Indra, 1, 8, 11, 12, 14, 19, 20 21, 22; Indrânî, 2, 3, 4, 5, 6, 9, 10, 15, 16, 17, 18; and Vrishâkapi, 7, 13, 23. The same distribution is given in the Brihad-devatâ by Shaunaka. Piscel and Geldner introduce Vrishâkapâyî in the dialogue and distribute the verses somewhat differently thus, Indra, 1, 3, 8, 12, 14, 19, 20; Indrânî 2, 4, 5, 6, 9, 16, 21; Vrishâkapi 7, 10 13; and Vrishâkapâyî, 11, 15, 17, 18. Verses 22 and 22 are supposed to be addressed by a stranger, the narrator.

VERSE 1.—The verse has been differently interpreted by different writers. Yaska (13. 4.) interprets it as referring to the rays of the sun, which (the rays) deem themselves perfectly independent of the luminary by which they were Sayana ascribes it to Indra who says "that sacrificers, allowed by me to sacrifice to Vrishakapi, have disregarded me, but are praising the lord Vrishakapi who is delighted, as my friend, in the sacrifices, where plenty of Soma is used; [but notwithstanding] this Indra is superior to all." Mādhava Bhatta, whom Sayana mentions with respect, however, thinks otherwise. He considers that the verse is addressed by Indranî to Indra, when she perceived that the sacrificers have ceased to sacrifice on account of the oblations being spoiled by an animal representing Vrishakapi. He would, therefore, thus interpret the verse. Says Indrani, "In places of plenty where icrd Vrishakapi revels, sacrificers have give up sacrificing and disregarded Indra. My friend Indra is superior to all."

When the very first verse is thus interpreted in three different ways, one can easily attribute the difference to an imperfect perception of the bearing of the whole hymn. To me Mâdhava Bhatta alone appears to have taken into consideration the verses that follow. Thus the fifth verse of the hymn states that the things of Indrani were spoilt by Vrishâkapi in the form of an animal, and consequently he was beheaded. I should, however, like to refer to verse 21, wherein Vrishâkapi is told that when he appears again, sacrifices would be performed. This evidently implies that they were stopped before and were to be commenced again on the re-appearance of Vrishâkapi. The first verse therefore must be interpreted to mean that "the sacrifices are stopped." The root srij with vi may mean either to abandon

or to allow, but the former is its natural meaning, and when verse 21 in the same hymn can be easily explained by taking the former meaning of srij with vi, it would be straining the words if we put a different interpretation on them. I am, therefore, disposed to interpret the verse after the manner of Mâdhava Bhatta, except the last sentence.

But why should sacrifices be stopped? What has Vrishâkapi to do with them? These are very important questions, and I am sure that had they been properly answered, there would have been no difficulty in interpreting the hymn. In verse 3 we are told that Vrishakapi spoken of in this hymn, has the form of a yellow antelope. In verse 5 Indrâni is prepared to cut off his head, because he offended her, and in the preceding verse (4th) a dog is said to be let loose upon him. These facts-an antelope with the head cut off, and a dog closely following him-are quite sufficient for the purposes of identification. They shew that the whole story is based upon the "antelope's head" we have previously discussed; and had Yaska and Sayana known that there is a constellation called dog in the heavens by the side of Mrigashiras, I feel certain that they would not have hesitated to recognize in Vrishâkapi, the sun as represented by the constellation of Orion. But all traces of the dog, as a constellation, having been lost in the Sanskrit literature, neither Yaska nor Sayana could find any clue to the true meaning of the hymn. This is not, however, the only place where Yaska has been obliged to invent extraordinary interpretations. Not knowing that the dog represented a star, he has proposed (Nirukta 5. 20), that Vrika should be understood to mean "the moon," while usually it means a wolf or a wild dog, and it appears to

me that a similar mistake has been also committed here. Comparative Mythology and Greek Astronomy have, however, thrown further light on the subject, and we must now try to interpret the hymn accordingly. Vrishâkapi must, therefore, be taken to represent the sun in Orion.

But even supposing that Vrishâkapi thus represents the sun in Orion, why should the sacrifices be stopped on his account? The identification of Vrishakapi with Orion at once furnishes us with a solution of this question. have already seen that the dog is said to commence the new year in Rig. i. 161. 13; and since Canis and Orion are close to each other, Orion may also be said to have commenced the year. The Devayana, therefore, extended in those days from the heliacal to the acronycal rising of Orion; that is, when Orion rose with the sun, it was the vernal equinox, the beginning of the Devayana, and six months after, when it rose at the beginning of night, it was the autumnal equinox, the end of the Devayana. Now all Devaceremonies and sacrifices could be begun and performed only during the Devayana,* or, as we find it in later traditions, only in the Uttarâyana. The acronycal rising of Orion was thus a signal to stop such ceremonies, and oblations could properly be said to have been spoilt by the appearance of this constellation at the beginning of night.† But above all the burden of the song "Indra is uttura of all," becomes specially appropriate in this case. The word uttara

^{*} Jaimini Mim Dar. vi. 8, 23, and other authorities cited in Chap. II.

[†] If Vritra is correctly identified with the constellation of Mrigashiras, we may on the same theory also explain why he is called Makhasyu in Rig. x. 73. 7. The appearance of Mriga, at the beginning of night indicated the commencement of the Dakshi nayana when sacrifices were stopped. Vritra alias Mriga might thus come to be regarded as a destroyer of the sacrifices.

does not here mean superior, but "upper" implying that Indra is in the upper or the northern portion of the universe, though the sun or Vṛiṣhâkapi may go down. I would therefore translate the first verse thus:—"Where my friend Vṛiṣhâkapi rejoiced in the wealth of the Aryans, they gave up sacrificing and did not respect Indra. Indra is (however) in the upper (i. e., northern) part of the universe."

Verse 2.—Indra is here reproached for following up Vrishâkapi, though he has offended Indranî. Says she to Indra: "O Indra! (how is it that) you run down fast after Vrishâkapi and do not go anywhere else to drink soma. Indra is, &c."

The word para in this verse seems to denote the region where Vrishakapi has gone. Paravat is often said to be the place in the distant or lower portion of the sphere, and is thus contrasted with arvavat (Rig. viii. 13. 15). In Rig. viii. 33. 10 Indra is said to be Vrisha in the paravat and also in the arvavat regions. Indra is again very often spoken of as going to distant regions to see whether Vritra is duly killed. The same fact appears to be here expressed in a different form.

VERSE 3.—Sâyaṇa following the Anukramaṇi, understands the verse as addressed by Indraṇi to Indra. Ludwig and Grassmann, on the other hand, take it to be addressed by Indra to Indraṇi: and this construction seems better than that of Sâyaṇa. It may, however, be here, once for all, remarked that though scholars thus differ in assigning verses to different deities, yet it does not, on the whole, materially alter the legend incorporated in the hymn.

If Vrishâkapâyî is to be at all introduced in the dialogue, we may assign this verse to her. The phrases, "my friend" and "did not respect Indra." would be more appropriate in her mouth than in that of Indra or Indrani.

Says Indra: "What has this Vrishâkapi, in the form of a yellow antelope, done to thee that you are so much angry with him? Was it the rich possession (wealth) of the Aryans? Indra, &c. "

The form, in which Vrishâkapi is here said to have appeared, should be specially noted. Harita means yellow, and yellow animals (Haritah) are said to be yoked to the carriage of Aditya in Nighantu (1.15). There the word is, however, understood to be the plural of Harit, by the commentators in conformity to Rig. i. 115. 3 and v. 45. 9, where the sun is said to have seven horses yoked to his carriage. But I think that the same idea may give rise to the conception that the sun is represented by a single yellow animal, and we may take the passage in the Nighantu as referring also to the verse under consideration. I have previously alluded to the fact that the dog at the Chinvat bridge in the Parsi traditions is described as zaritem, that is, of the same colour as the antelope in the third verse. But the question of colour cannot be taken as finally settled until we first definitely decide what animal is represented by Mriga.*

Verses 4 & 5.—Sâyana is literally correct, but again misses the spirit, or rather has missed it throughout the hymn. Indra was reproached in the second verse for his partiality or over-kindness to Vrishakapi. But Indranî was not satisfied with it, and if Indra failed to punish the Kapi, she took the matter in her own hand. Says she: "O Indra! as you (thus) protect this (your) favourite Vrishâkapi, let the dog, eager (to chase) a hog (varâha), bite him at his ear. The Kapi spoilt my favourite things. † I shall, there-

^{*} See D. Rajendralal's Indo-Aryans, Vol. II., p. 303.

[†] The word in the original is tashtani, which literally means made, shaped, &c. Madhava Bhatta understands it to mean

fore, cut off his head, in order that an evil-doer may not enjoy happiness. Indra is in the upper (portion) of the universe." Here Indrani is herself prepared to punish Vrishâkapi by setting the dog at his ear, and cutting off his head. I have in a previous chapter shown how the figure of Mriga's head is to be obtained in the sky. Taking the three stars in the belt of Orion as the top of the head, the dog is close by the right ear of Mriga and may properly be said to hite it. The word varáha also points out the place where we may expect to find the dog. In Rig. i. 61.7, varaha* is said to be killed by Vishnu beyond a mountain, which, in all probability, is the same story as that of Indra killing Vritra. A dog chasing varaha is therefore no other than Canis Major following the constellation of Orion, or the "antelope's head "representing Vritra. Sâyana and Yaska and even European scholars are silent as to who this dog is. The verses, in fact, may be said to have remained altogether unexplained hitherto, though the words themselves are simple enough and have eaused no difficulty.

VERSE 6.—This verse presents no difficulty. Thus satisfied, Indrani speaks of herself as the best of women, best in every way.

VERSES 7 & 8.—Indra now tries to conciliate her. Sayana, following the Anukramani, supposes that the seventh verse is addressed by Vrishakapi and the eighth by Indra. The only reason I can find for such an interpretation is the

oblations offered to Indrani. I translate it by things generally. Whatever meaning we may adopt, it is quite evident that the Kapi's interfering with them has offended Indrani.

^{*} In Rig x, 99, 6, Indra is said to have killed Trishirshan, and with his aid Trita killed varáha.

occurrence of the word amba, which means "mother," and this cannot be supposed to be used by Indra. But though we avoid one difficulty in this way, we are launched into another, for the verse speaks of Indrani being pleasing "to me;" and if Vrishâkapi is the speaker "me," cannot refer to him, as Indrani is his mother and, consequently, "me" has to be interpreted to mean "my father," and this Sâyana has done. I preser taking ambû as an affectionate and respectful mode of address, as in modern Sanskrit, and the verse presents no difficulty. We can then take both the 7th and the 8th verse together and give them a natural interpretation. I translate thus "O auspicious lady! what you say is true.... you are pleasing to me... But oh! hero-wife, with beautiful arms, pretty figure, profuse hair, and broad hips, why should you be so angry with our Vrishâkapi? Indra is in the upper (part) of the universe."

Verse 9.—Indranî replies, "This mischievous (Vrishâkapi) considers me to be avîrâ (i. e., without a brave husband or son), while I am the wife of Indra, the mother of the brave, and the friend of Maruts. Indra, &c."

VERSES 10 & 11.—Pischel and Geldner suppose that the first is addressed by Vrishâkapi to Indrâni, and the second by Vrishakapâyî. Sâyana understands them to be addressed by Indra. Whichsoever construction we adopt, the meaning remains the same. Indrani is here told that she is highly respected everywhere; she is the blessed of all women, and that her husband never suffers from old age. This is obviously intended to pacify her.

Verse 12.—Indra says "O Indranî! I am not delighted without my friend Vrishâkapi, of whom these favourile watery oblations reach the gods. Indra is in the upper (part) of the universe."

VERSE 13.—This seems to be also addressed by Indra to Indrânî, who is here called Vrishâkapâyi. This latter name has caused a difference of opinion, some considering Vrishâkapâyî to be the mother, some the wife of Vrishâkapi.* I do not see how the wife of Vrishâkapi as such, could be introduced in the song, unless Vrishakapi is understood to be the name of Indra himself. Commentators, who take Vrishâkapâyî to mean the wife of Vrishâkapi, accordingly adopt the latter view. Pischel and Geldner think that the verse is addressed by Vrishâkapi to his wife Vrishâkapâyî. The verse means, "O rich Vrishâkapayil having a good son and a daughter-in-law, let Indra swallow the bulls, your favourite and delightful oblation. Indra, &c." There has been much speculation as to who could be the son and the daughter-in-law of Vrishâkapâyi. But if Vrishâkapâyî be understood to mean the wife of Indra, it causes no such difficulty. The adjectives "having a good son." &c, are simply complimentary, corresponding to the statement of Indrânî, that she was the "mother of the brave" in verse 9. Indra accepting her statements, asks her to allow him to swallow the watery oblations said to come from Vrishakapi in the last verse. The words priyam and havis are the same in both the verses; and I think that both of them refer to the same oblations.

VERSE 14.—Indra, satisfied with the prospect of getting the oblations, describes his appetite: "Twenty and fifteen oxen are being cooked for me; I shall eat them and be fat. Both the sides of my belly will be filled up. Indra, &c."

See Max Muller's Lectures on the Science of Language, Vol. II., 538.

The practice of sacrificing bulls to Indra seems to have been out of date even at the time of the Rigveda (cf. i. 164. 43, where it is said to be an old custom). But the old custom could not be entirely forgotten, and if real bulls were not offered to Indra, poets supposed that clouds or stars might answer the same purpose. The number 35 mentioned in the verse may thus refer to the Nakshatras (28), and planets (7). But this explanation is doubtful and I cannot suggest a better one.

Veres 15, 16 & 17.—The fifteenth and the sixteenth seem to be addressed to Indra by Indrani, and the seventeenth to Indrani by Indra. In the fifteenth Indrani, according to bayana, asked Indra to sport with her just as a bull, with pointed horns, roars amongst a number of cows. The next two verses do not appear to be relevant to our purpose. We nay therefore pass these over, and resume the thread of the tory. Pischel and Geldner suppose that the 17th and 18th rerses are addressed by Vrishakapayi.

VERSES 18 & 19.—Indranî is now conciliated, and says hat she has not killed Vrishâkapi but some one else. The erse thus means, "O Indra! let Vrishâkapi get the slain nimal—an animal which was quite different from Vrishâkapi's. et him at once have a knife, a fire-place, a new vessel, and cart-load of firewood (to cook the killed animal). Indra, ic." Thus by the intercession of Indra, Indranî was moved, and at last undid or rather explained away her previous act f decapitation. Pischel and Geldner translate the verse very early as I have done. They, however, consider it to be ddressed by Vrishâkapyî and translate parasvantam by wild.' This does not explain what dead animal is here

dead animal here spoken of is the same as that described in verse 5, and one whose head Indrani is there said to be ready to cut off. Indranî now says that this dead animal should be given to Vrishâkapi, especially as Indra has already got his oblations of bulls. I have already shown that there were several legends about the "antelope's head." It seems that Indranî, referring to some of them, assures Indra that it was not Vrishâkapi in the form of the antelope which she killed, but some one else (literally parasvantam = representing another than Vrishakapi, as Sayana takes it.) Thereon Indra, having thus saved Vrishâkapi by his intercession, observes, "Thus do I go seeing and discriminating between a dâsa and an ârya; I take my drink from those that prepare Soma juice and cook the oblations, and thus behold or protect the intelligent sacrificers." In another word, Indra is glad that he has saved an Arya, and triumphantly declares that he is always careful to distinguish between an Arya and a Dasa, the latter of whom he would punish and kill, e. g., Vritra, who is said to be a Dasa. Vrihakapi being thus saved Indra, in the following verses, bids him a farewell, wishing for a safe journey and speedy return. These verses are very important for our present purpose, and I shall therefore examine them singly.

Verse 20—In this verse Indra asks Vrishâkapi to go to his house (astam) and then return afterwards to the house (grihas) of Indra. But the question is where is Vrishâkapi's house and where is that of Indra? The words in the original are dhanva, krintatra and nedîyas. Vrishâkapi is asked to go to dhanva, which is also krintatra. Sâyana takes dhanva to mean a desert and krintatra in the sense that "the trees therein are cut off." But this meaning

does not quite suit the context. What is meant by saying that Vrishkapi, who is admittedly the sun in a different form, should go to a forest? Where is that forest, and what does it imply? Dhanva is a word that occurs several times in the Rigveda. In Rig. i. 35. 8 it is said to consist of three yojanas and is contrasted with the earth. Savana there understands it to mean "sky or heavens;" and I see no reason why we should not interpret the word in the same way in this verse. Dhanva therefore means "sky" or "heavens." But is it the vault above with three stages? No, the poet qualifies the idea by krintatra, meaning "cut off." It is thus evidently the portion of the heavens which is cut off. In other words, the idea here denoted is the same as that expressed by the phrase avarodhanam divah-"where heavens are closed," ir "where the view is obstructed," in Rig. ix. 113. 8. Dhanva, which is kritantra, thus denotes the innermost part of the celestial sphere, the southern hemisphere or the Pitriyana. The poet knows that the vault of the heavens above him has three halts or stages which Vishnu is said to have used as his three steps (Rig. i. 22. 17). But of the nether world the poet has no definite knowledge, and he therefore cannot specify the yojanas or the stages it contains. Thus he simply says that there are some yojanas therein. The first part of the verse may now be translated thus: O Vrishâkapi! go to the nouse (in) the celestial sphere which is cut off and which contains some yojanas or stages." In short, Indra means that Vrishâkapi should now descend into the southern hemispere.

^{*} The only other place where krintatra is used in the Rigveda is v. 27. 13, which Yas a and Sayana both interpret to mean that "waters come up from krintatra i. e., a cloud." But it may be as well asked if krintatrat cannot here mean "from below."

The latter part of the verse literally means "and come to our house from nediyas." Now nediyas is again a word which neither Yaska nor Sayana seem to have properly understood Paninr (v. 3.63) tells us that nedivas is the comparative of antika. Now nedivas cannot possibly be derived from antika by any change in the form of the latter word. Panini therefore considers neda to be a substitute for antika, when the comparative form is to be derived. This is equivalent to saying that 'bet' is to be substituted for 'good' in deriving the comparative form of 'good' in English. I need not say how far such an explanation would be regarded satisfactory. My own view is that nedigas had lost its positive form in the times of Panini, or perhaps its positive form was never in use like that of 'superior' in English. But Pânini, who, as a grammarian, felt bound to account for all the forms, connected nediyas with antika, probably because the ordinary meaning of nediyas in his time was the same as that of the comparative form of antika. But we cannot infer from this that nedivas might not have meant anything else in the days of Panini. Panini might have taken into account only the most ordinary sense of the word, and finding that a positive form was wanting connected it with the word which expressed the ordinary meaning in the positive form. The fact that Panini considers nedivas as the comparative of antika does not therefore preclude us from assuming, if we have other grounds to do so, that nediyas originally meant something else in addition to its present sense; for Panini speaks of the form and not of the meaning of nedivas. Having thus shown that the authority of Pauini is not against me, I shall now give my meaning of nedivas. I think it means lower, being akin to neath, beneath, nether' and corres-

^{*} Bopp derives O. H. G. nidar from Sk. mi down, and disapproves Grimm's suggestion that it should be traced to a Gothic

oonding words in other languages. The suggestion, I know, will be received by some with surprise and suspicion, and I must give my grounds for proposing a new meaning. There is no passage in the Rigveda where the use of nediyas might be considered as definitely deciding its meaning. In Rig. v. 52. 6, viii. 26. 10 and x. 101. 3, nedishtha or nediyas might be supposed to mean lowest or lower. But the passages are not conclusive on this point, as the word there used might also be understood to mean 'nearest,' 'nearer,' according to Panini. în the Brâhmanas we, however, meet with more decisive oassages. Thus in the Aitareya Brâhmana vi. 27 nediyas is eentrased with uparishthat.* Böhtlingk and Roth give a passage from the Kâthaka recension of Yajurveda (28. 4), which says, the ascends (arohati) to the heavens from the nethistha world."+ Here the word 'ascend' clearly shows that the netishtha world must be understood to mean the 'lowest world,' world at the bottom.' In the Tandya Brahmana (iii. 4, 2, (3, 2) there occurs a passage where the directions for lowering

erb nithan, nath, nethum, and divided as nid-ar, ar being a omparative termination. (Bopp, Com. Gr. Eng. Tr. 1860, Vol. I., (382). K. Brugmann compares Sk. nediyas with Av. nazd-yan neaning 'nearer,' and derives the words from nazd (ni down and ed to stt). Cf. Sk. nida Lat. nidu., O. Ir. net, O H. G. nest = a esting place (Comp. Gr. i., § 591, ii. §§ 4, 135). Both Bopp and Brugmann do not propose any new meaning of nediyas. But it is vident that which soever derivation we adopt the word is connected with ni down, and if we find passages in the Biahmanas where it is ontrasted with upari-shtât, we can, I think, safely understand ediyas to mean 'lower' as suggested by its etymology; 'nearer' is secondary meaning.

^{*} **अपरिष्टा बेदीयासे भागे Ait.** Br. vi. 27.

ने विष्टादेव स्वर्गका कमारोहति। Kathak. 28. 4

the tone are given as follows:—"Just as after creeping up to the top of a high tree (a man) gradually comes lower and lower so, &c."* The word for lowering in the text in nediyas sankramât, and there is no possibility of mistaking its meaning. In the Tândya Brahmana ii. 1.3 the raising of the tone is described as ascending from top to top (agrât agram); and nediyas sankrama must, therefore, mean a gradual lowering of the voice. In fact, nediyas sankrama represents the same idea as low-er ing, that is, not taking a sudden leap down but descending from the highest point to the next lower, and so on. In all these places Sâyana explains nediyas as meaning 'nearer' according to Pânini; but in every case he has to strain the words to suit the context. It was not, however, Sayana's fault; for after nediyas was once assigned to antika, all traces of its old meaning were naturally lost, and none dated to question Pânini's authority. But we now know that in other languages neath means low, and in several passages in the Brâhmanas, we find nedi, as contrasted with 'upper' or 'top.' This, in my opinion, is sufficient to prove that nediyas meant lower in the Vedic times. I have already shown that the authority of Panini is not against understanding the word in this way. All that he has laid down is that nediyas having no positive form should be derived from antika without saying whether nediyas was or was not used in any other sense. I am therefore inclined to think that nediyus might have had more than one meaning even in Panini's time, but he took the most ordinary meaning and derived the comparative form from antika. This is course

^{*} यथा महावृक्षस्याप्रं सृह्दा नेदीयः संक्रमात् संक्रामत्येवमेतचेदीयः संक्रमया नेदीयः संक्रमात् संक्रामति । Tân. Br. iil. 4. 2.

of time served in its turn to restrict the denotation of the word only to one meaning, viz., 'nearer.'

I would therefore translate the verse thus, "O Vrisha. kapi! go to the house—the celestial sphere which is cut off and which contains some (unknown) yojanas or stages. From your nether house come to our house. Indra is in the upper (portion) of the universe." Nedivas is thus contrasted with ultara in the burden of the song. Both are comparative forms. Indra is in the uttara (upper) regions, while Vrishakapi is going to the nedîyas (lower) world; and Indra expects or rather requests Vrishakapi to come back again to his (Indra's) house. That is the gist of the whole verse. The idea that the sun falls down from the autumnal equinox is an old one. In Ait. Br. iii. 18 and in Taitt. Br. i. 5. 12. 1 the ceremonies on on the Visûvân or the equinoctial day in a satra are described, and there we are told that "gods were afraid of the sun falling down from the sky and so supported him," and being thus supported he "became uttara to all." The Ait. Br. iii. 18 has thus the same word uttara that we have in this verse. and it is natural to suppose that both relate to the same subject. I have also quoted a passage from the Aitareya Brâhmana where nedîyas is contrasted with uparishtat. From these I infer that the verse, we are now considering, describes the descent of the sun into the southern or the lower hemisphere, and that Indra asks him to come back again to the house of Gods, i.e., the northern hemisphere. I have already given in full my reasons for unders anding nedivas in a different sense. But I may remark that, even accepting the common meaning of the word, the verse may still be interpreted in the way I have suggested.

Verse 21.—Vrishakapi has gone down to the nether

world. This verse now describes what Indra will do when he Says Indra, "O Vrishakapi! you, the destroyer of sleep, who are going to the house, come back again, again by (your) way. We would perform the sacrifices. Indra, &c." The verse thus distinctly refers to the recommencement of the sacrifices in the Devayana or the Uttarâyana as understod in old days. The word suvità is from the same root as vâitanika and kalpyâvahai is from krip, the root which gives us the word kalpa in kalpasûtras. Savita kalpayâvahai thus means "we would perform the vaitanika ceremonies," which, as described in the first verse, were stopped when the sun went down to the neither world I may also here point out that the house in the nether world or, as Sayana interprets it, the house of the enemy is called asta literally 'thrown,' while Indra's house is called griha. The sun goes down to the asta and returns up to the griha of Indra. This verse, in sofar as it speaks of the recommencement of sacrificial ceremonies, confirms the interpretation I have proposed for the preceding verse.

VERSE 22.—This is the most important verse in the whole hymp. It describes the circumstances under which Vrishâkapi will return to Indra's house. Literally rendered it means, "O mighty Vrishâkapi!" when you rising up-

^{*} Pischel and Geldner suppose that the verse is addressed by a third person to Vrisåkapi and Indra, probably because both these names occur in the vocative case and the verb is in plural. In that case the verse would mean, "When Indra and Vrishåkapi would both be in the house. where would the sinning Mriga be, &c.?" This interpretation does not, however, make any change in the part of the verse material for our purpose. For which so ever construction we adopt the question still remains—why is the Mriga invisible when both Indra and Vrishåkapi are together?

wards (or rather northwards) would come to (our) house, where would that great sinner Mriga be? Where he, who misleads people, would go? Indra, &c." Now Yâska, in whose days all traces of Canis being once a star in the heavens were lost, could not understand what to make of the statement "where would that great sinner Mriga be?" It means that Mriga would not be seen, would not be visible, when Vrishâkapi goes to the house of Indra; but Yâska did not perceive what was intended by such a statement. He could not conceive that the constellation of Mrigashiras would be invisible, when the sun in his upward march would be there at the beginning of the Devayana, that is, when he comes to the house of Indra, and therefore he proposed to interpret Mriga in the sense of "the sun" (Nirukta 13. 3). Mriga, says he, is derived from mrij to go, and means "going," "one who goes and goes and never stops,' in other words, "the sun." Now, says his commentator, when a person goes into a house he cannot be seen by the outsiders. So Vrishâkapi, when he goes to the house, cannot be seen by the people on the earth! I do not think that I need point out the highly artificial and inconsistent character of this explanation. The word Mriga, so far as I know, is no where used in the Rigveda in this sense. Again, if the word Mriga in the third verse of this hymn is to be understood as meaning an antelope. is it not natural enough to suppose that the same Mriga is referred to in this verse? Then, again, how can the sun be said to become invisible to the people when he is in the house of gods? Nor can he be invisible to Indra whose house he enters. What can, in such a case, be the propriety of the word udancha or "rising upwards"? If Mriga means the sun according to Yaska, we shall have to suppose that the

ising sun was invisible, a clear contradiction in terms. I am ure Yaska, here, tried to explain away the difficulty in the ame way as he has done in the case of Vrika. But, in the resent instance, the solution he has proposed is, on the face f it, highly inconsistent, so much so that even Sayana, does ot follow it. Sayana, however, has nothing else to propose, nd he quietly leaves the word Mriga as it is and unexplain. d in his commentary. In short, both Sayana and Yaska ave found the verse too difficult to explain. The meaning I ave proposed explains the verse in a natural and a simple namer, and further corroborates the statement in the igveda previously referred to viz., "Canis awakened ne Ribhus at the end of the year." In the Taittiriya rânmana i. 5. 2. 1, we are told that the Vedic priests, Z., Mälsoni, observed the position of the sun amongst ars in the morning, and, as the Nakshatras disappear hen the sun rises, they determined the position by observig what Nakshatra rose a little before the sun. The resent verse records an observation to make which no reater skill is required. It tells us that when Vrishakapi ent to the house of Indra his Mriga was not visible anythere, thus clearly indicating that sun rose with Orion n that day. The word udancha is especially remarkable this case. The sun must be udancha when he goes to ne house of Indra, which, the burden of the song tells us, in the northern or the upper part of the universe This erse, therefore, clearly describes not merely the rising sun, at the position of the rising sun amongst the constellations then he is at the vernal equinox, the entrance of the house f gods or the house of Indra. Sayana and Yaska have omnletely missed this point, and have made Vrishak ani (Nirukta 12. 12). If the meaning I have proposed is correct, we have here a record of the position of the sun at the vernal equinox. I take pulvaghas in the original to mean "great sinner;" but it may be translated as Yaska proposes by "omnivorous" or "voracious." But in either case I would take it as referring to the antelope's spoiling the things of Indran. The point is that the sinning Mriga would not be with Vrishakapi when he again goes to the house of Indra, and Indran would have no cause to complain of the presence of the odious Mriga at the time.

Verse 23.—Sâyana translates, "O arrow! Manu's daughter, named Parshu, gave birth to twenty (sons) logether. Let her whose belly was big be happy! Indra is in the upper (portion) of the universe." I cannot, however, understand what it means. Parshu, according to Sâyana, is a Mrigî or a female antelope. But why address the arrow to give happiness to her? Can it have any reference to the arrow with which Orion was killed? Then who are these twenty sons? Are they the same as twenty mentioned in verse 14? Is it likely that twenty alone are mentioned leaving the additional fifteen to be understood from the context? The concluding verse undoubtedly appears to be benedictory. But I have not found a satisfactory solution of the above questions. Perhaps bhala meaning 'auspicious,' may be used for Vrisha. kapi, and Indra addressing him pronounces benediction on the female that gave birth to the yellow antelope and several other stars that are supposed to be either killed or swallowed by Indra in this hymn. But I cannot speak with certainty on the point and must leave the verse as it is.

Now let us see what are the leading features of the story of Vrishakapi and what they signify. We have seen

that scholars differ in assigning the verses of the hymn to the different speakers, and here and there we meet with expressions and words which cannot be said to be yet satisfactorily explained. Some of the interpretations I have proposed may not again be acceptable to all. But these difficulties do not prevent us from determining the leading incidents in the legend, which may therefore be summarised somewhat as follows. Vrishakapi is a Mriga, and sacrifices are stopped where he revels. He is, however, a favourite of Indra, and consequently the latter, instead of punishing, follows him. Indrani, who has herself been offended by the Kapi, now reproaches Indra for his overfondness for the animal and threatens to punish the beast by cutting off his head and letting loose a dog at his ear. Indra intercedes and Indrani assures him that the punishment has not been inflicted on his favorite beast, but on someone else. Vrishàkapi is now going down to his house and Indra, in bidding farewell to his friend, asks him to come up again to his (Indra's) house, so that the sacrifices may be recommenced; and, strange to say, that when Vrishakapi returns, in his upward march to the house of Indra, the impertinent Mriga is no longer to be seen! Vrishakapi, Indra and Indranî thus finally meet in the same house, without the offensive beast, and the hymn therefore concludes with a benedictory verse.

There can be little doubt that the hymn gives a legend current in old Vedic days. But no explanation has yet been suggested, which accounts for all the incidents in the story or explains how it originated. Vrishâkapi is a Mriga, and his appearance and disappearance mark the cessation and the recommencement of the sacrifices. The Indian tradition identifies him with the sun in one form or another and

comparison with Greek Erikapaeos point to the same conclu sion. Our Vrishâkapi or Mriga must again be such as i liable to be conceived in the form of a head cut off from the body, and closely followed by a dog at its ear, unless we are prepared to treat the very specific threat of Indranî a meaningless except a general threat. All these incident are plainly and intelligibly explained by taking Vrishakap to represent the sun at the autumnal equinox, when the Dog-star or Orion commenced the equinoctial year; and above all, we can now well understand why Vrishakapi' house is said to be low in the south and how his Mrig: disappears when he goes to the house of Indra-a poin which has been a hard knot for the commentators to solve I, therefore, conclude that the hymn gives us not only a description of the constellation of Orion and Canis (verse 4 and 5), but clearly and expressly defines the position o the sun when he passed to the north of the equator in old times (verse 22); and joined with the legend of the Ribhu we have here unmistakeable and reliable internal evidence of the hymns of the Rigveda to ascertain the period wher the traditions incorporated in these hymns were first framed and conceived. In the face of these facts it is impossible to hold that the passages in the Taittiriya Sanhita and the Brahmanas do not record a real tradition about the older beginning of the year.

CHAPTER VIII.

CONCLUSION.

We have thus traced back one of the traditions about the old beginnings of the year, mentioned in the Taittiriya Sanhitâ, to the oldest of the Vedic works, and what is still more important, shown that the Vedic traditions are in the important completely corroborated by the oldest records and traditions of the other two sections of the Aryan race—the Parsis and the Greeks. The traditions of each nation taken singly may not be conclusive, but when, putting all these together, and interpreting one set in the light of another, we find that directly or indirectly all point to the same conclusion, their cumulative effect cannot but be

conclusive. Scholars have already discovered the similarity between the traditions of the three nations; but without any clue to the period when all the Aryas lived together, it was impossible to reduce all these traditions into a harmonious whole. The traditions of Orion, and especially its position at the beginning of the equinoctial year, do, however, supply such a clue, and with its help the mystery about the oldest periods of Aryan civilization is considerably cleared up. Thus if Orion is now no longer a hunter of unknown parentage, we need not also indulge in uncertain speculations about the foamy weapon with which Indra killed his enemy, or how the four-eyed dogs came to be stationed at the Chinvat Bridge, or why the Ribhus are said to be awakened by a dog at the end of the year.

Astronomically the matter is as simple as it could be. All our measurements of time are directly based upon the changes in the positions of heavenly bodies. But there is no measurement of time, at present determined, which is longer than the period during which the equinoxes complete their revolution in the ecliptic. It is, therefore, the best measurement of time for determining the periods of antiquity, only if we have reliable records about the position of heavenly bodies in early days. Fortunately, such records of the time, when the Hellenic, the Iranian and the Indian Aryans lived tegether, have been preserved for us in the Rigveda, and with the help of the Greek and Parsi traditions we can now decipher these records inscribed on the specially cultivated memory of the Indian Aryans. Commencing with the passages in the Taittiriya Sanhita and the Brahmanas, which declare that the Phalguni fullmoon was once the new-year's night, we found that Mriga-

shiras was designated by a name which, if rightly interpreted, showed that the vernal equinox coincided with that asterism in old times. This was, so to speak, a sort of corroborative evidence of the truth of the statement in the Taittiriya Sanhità. A reference to the figure will show at a glance that if the sun be at the winter solstice on the Phalguni full moon day, the moon to be full must be diametrically opposite to the sun and also near Phalguni. Uttarâ Phalgunî will thus be at the summer solstice and the vernal equinox will coincide with Mrigashiras. With the solstice in Mâgha, the equinox will be in the Krittikâs; while when the Uttarâyana begins in Pausha the equinox is in Ashvinî. Ashvinî and Pausha, Krittikâs and Magha, and Mrigashiras and Phâlguna are thus the correlative pairs of successive year-beginnings depending entirely upon the precession of the equinoxes; and the facts, statements, texts and legends discussed in the previous chapters supply us with reliable evidence, direct and indirect, of the existence of all these year-beginnings in the various periods of Aryan civilization. It has been further shown that not only the traditions but also the primitive calendar of the Parsis bears out the conclusions we have deduced from the Vedic works.

We have so far considered only one of the traditional year beginnings recorded in the Taittiriya Sanhitâ, the Phalguni sull-moon. But it may be asked how we interprete the other mentioned along with it, and almost in the same words. Analogy at once suggests that we should interprete it in the same way as we have interpreted the first. With the Phalguni sull-moon, at the winter solstice the vernal control was in Mrigashiras: so with the Cnitrâ sull-moon

Let us, therefore, see if we have evidence in the Vedic literature in support of such an in terpretation. It may be observed that we are here entering upon the remotest period of antiquity, when the year was probably first determined with some approach to accuracy; and even in the Vedas there is hardly anything beyond vague traditions about this period, while the Greeks and the Parsis have not, it appears, preserved even these.

There is no express passage which states that Punarvasû was ever the first of the Nakshatras, nor have we in this case a synonym like Agrahâyana, or Orion, wherein we might discover similar traditions. There are, however, some indications about the oldest position of Punarvasû preserved in the sacrificial literature. The presiding deity of Punarvasû is Aditi, and we are told in the Aitareya Brâhmana i. 7, and the Taittirîya Sanhitâ vi. 1. 5. 1, that Aditi has been blessed with a boon that all sacrifices must commence and end with her. The story begins with the statement that the Sacrifice (the mysterious sacrificial personage) went away from the gods. The gods were then unable to perform any further ceremonies, and did not know where it (the sacrifice) had gone to; and it was Aditi that helped them, in this state, to find out the proper commencement of the sacrifices. This clearly means, if it can mean anything, that before this time sacrifices were performed at random, but it was at this time resolved and fixed to commence them from Aditi. Aditi was thus the oldest and the first commencement of the sacrifice or the year. In the Vajasaneyi Sanhita 4. 19 Aditi is said to

Ait. Br. i. 7. A similar tradition about Orion is narrated in Greek mythology. Ult is stated that having lost his sight he followed a guide to the east in search of the sun and there, by, exposing his face to the rising sun, his sight was restored.

be ubhayatah shîrshnî, "double-headed," and the commentators interpret it to mean that the two termini of the sacrifices, which began and ended with Aditi, are the two heads here alluded to. These traditions are further corroborated by the sacrificial ceremonies. According to the sacrificial terminology the 4th day before Vishûvân or the central day of the yearly satra is called the Abhijit day. "In the sixth month," observes Dr. Haug,* "there are three Abhiplava, shalahas (six-day's periods) and one Prishthya shalaha." This makes up the first 24 days of the sixth month. The following days are thus enumerated: the Abhijit day, the three svarasaman days and the Vishuvan, or the central day which stands quite apart." Thus if we exclude the Vishûvân day, as standing apart by itself, this gives us four days, and with the two days-Atiratra and Chaturvinshawhich are taken up by the initial ceremonies of the satra, we make up the shalaha wanted to complete the six months. The Abhijit day thus falls on the fourth day before the Vishûvân. Now if Abhijit day be supposed to be named after the Nakshatra of that name (i.e., when the sun is in Abhijit) then the Vishûvân, or the autumnal equinox must fall four days-or as the sun travels over about 1° of the ecliptic each day, 4°-after the asterism of Abbijit; and it can be shewn by attronomical calculation that, with Aditi or Punarvasû at the vernal equinox to commence the sacrifice, we get nearly the same result. In the Sûrya Siddhânta (viii. 3 table) the longitude of Punarvasû is said to be 93°, while that cf Abhijit is 266° 40', that is, in other words, Abhijit would be about 6° behind the

^{*} See Dr. Haug's translation of the Aitareya Erâhn ana iv. 12, p. 279, note.

autumnal equinox or Vishuvan, if we suppose the vernal equinox to exactly coincide with Punarvasû. With the vernal equinox in Funarvasû there is again no other Nakshatra nearer to or at the autumnal equinox to mark the Vishûvân day. We can, therefore, now understand why Abhijit, which is so far away from the ecliptic, should have been included in the old list of the Nakshatras. It marked the approach of the Vishûvân in the primitive sacrificial calendar, but when it ceased to be used for that purpose owing to the falling back of seasons, it was naturally dropped from the list of the Nakshatras, as it was far away from the Zodiac. If Bentley's suggestion about Mûla and Jyeshthà be correct, this must have been done at the time when the vernal equinox was in Orion. But be that as it may, it will, I think, be clear from the above that the position of the Abhijit day in the sacrificial literature fully supports the tradition about Aditi, the presiding deity of Punarvasû having discovered the commencement of the sacrifice. Aditi at this time must have also separated the Devayana from the Pitriyana and thus may have been appropriately called the mother of the Devas (Rig. x. 72. 5). It was from her that the Adityas were born (Rig. x. 72. 8; Shat. Br. iii. 1. 3. 2.), or the sun commenced his yearly course.

^{*} Aditi is here said to be the daughter of Daksha, also cf. Rig. vii. 66. 2. In Puranic traditions the 27 Nakshatras are said to be the daughters of Daksha who gave them to the moon. If we combine these two traditions Aditi would be at the head of all the Nakshatras, in the same way as Mrigashiras or the Krittikas headed the list in later times. There are again many legends in the Puranas, stating that everything was born from Aditi. We can account for all these facts if we place Aditi at the vernal equinox, when the calender was first fixed for he sacrificial purposes.

The only other tradition I could find in the Vedic literatre about this position of Aditi is the story of the asterismal rajâpati given in the Taittiriya Brahmana (i 5. 2. 2).* The terism of Chitra is here said to be the head of this Prajapati, râti the heart, Hasta the hand, Vishikha the thighs, and nùrâdhâ the foot. Many conjectures are made about the eaning of this figure, but none of them satisfactorily explains hy Prajapati, who is said to be the god of time or the strum of years in the Vedanga Jyotisha, should have been presented in this way. I propose that we should interpret after the manner of a similar representation of Brahman by adarayana, † wherein the different signs of the Zodiac are id to be similarly related to the different parts of the body Brahman or the Creator. Prof. Max Müller has thus anslated the verse: - "The ram is the head, the face of the reator is the bull, the breast would be the man-pair, the eart the crab the lion the stomach, the maid the hip, the lance-bearer the belly, the eighth (scorpion) the membrum, e archer his pair of thighs, the Makara his pair of knees, e pot his pair of legs, the fish his two feet." Thus if esha was Brahman's head when the Rashis were introduced nitrà could well be said to be the head of Prajapati when

e Chitrà full-moon commenced the year. But though we

[;] India; what it can teach us? pp. 322, 323.

can thus satisfactorily account for the fact why Chitrâ should have been called the head of Prajapati, yet we cannot give an equally satisfactory reason in the case of one of the Nakshatras in this representation, unless we place three intercalary months in five years. It is, however, very difficuit to determine how the intercalary months were inserted, if at all, at this remote period, and the question must therefore, to a certain extent, remain unsolved for the present. The analogy of the pictorial representation of the twelve signs of the Zodiac in later days, is, however, a strong ground to hold that the asterismal Prajapati may have been similarly conceived when the primitive year was first determined on the Nakshatra system. There is, so far as I know, no more evidence about this primitive calendar in the Vedic works, than what has been given above. But the traces of such period which we can discover in the sacrificial literature and especially the express mention in Taittirîya Sanhitâ that the Chitrâ full-moon once commenced the year are, in my opinion, sufficient to prove the existence of such a calender in the primitive days. We cannot otherwise account why the first and last offerings in every sacrifice should be made to Aditi and why Abhijitday should precede the Vishûvân by four days. Compared to the evidences of the Orion period, these are slender materials for the construction of the primitive Vedic calendar, but they are decidedly superior to the materials on which Dr. Geiger has determined the primitive calendar of the Iranians.

It appears to me therefore that the oldest Vedic calendar, like the oldest hymn, was sacrificial; and that the sacrifice or the year commenced with Aditi at the vernal equinox in or near Punarvasû. The phases of the moon, the seasons

and the ayanas further guided the ancient Aryas in measuring time for sacrificial purposes. The asterism of Abhijit marked the approach of Vishûvân or the central day, while Punarvasû, which soon after came to be called Yamakau, perhaps Yama and Yamî, indicated the begining of the year. Sometime after this and before the vernal equinox had receded to Orion, the lunar months and tithis or days appear to have come in use; and, in fact, the whole calendar seems to have been rearranged, the year being made to commence from the winter solstice in the Chitrâ full-moon. But this did not alter the sacrificial system, which, so far as the procedure is concerned, still continues to be what it was in the oldest days. For all civil purposes the new calendar was, however, at once adopted and the two systems have continued to exist side by side up to the present day, though in a consider ably modified form, as described before in the second Chapter.

The oldest period in the Aryan civilization may therefore be called the Aditi or the pre-Orion period, and we may roughly assign 6000-4000 B. C. as its limits. It was a period when the finished hymns do not seem to have been known and half-prose and half-poetical Nivids or sacrificial formulæ "giving the principal names, epithets, and feats of the deity invoked" were probably in use. The Greeks and the Parsis have retained no traditions of this period, for the simple reason that they carried with them only the calendar which was in force when they left the common home, while the Indian Aryas have preserved all the traditions with a super-religious fidelity and scrupulousness. It is thus that I explain why the oldest Greek and Parsi traditions do not go beyond Orion.

We next come to the Orion piriod which, roughly speaking extended from 4000 B. C. to 2500 B. C., from the time when the vernal equinox was in the asterism of Ardra to the time when it receded to the asterism of the Krittikas. This is the most important period in the history of the Aryan civilization. A good many sûktas in the Rigveda (e.g., that of Vrishakapi, which contains a record of the begining of the year where the legend was first conceived) were sung at this time, and several legends were either formed anew or developed from the older ones. The Greeks and the Parsis appear to have left the common home during the latter part of this period as they have retained most of these legends, and even the attributes of the constellation of Mrigashiras, otherwise called Agrayana, Orion or the Paurysni. We can now easily understand why no confirmatory evidence about the Krittika-period is found either in the Rigveda or in the Greek and Parsi legends and traditions. This was pre-eminently the period of the hymns.

The third of the Krittika-period commences with the vernal equinox in the asterism of the Krittikas and extends up to the period recorded in the Vedanga Jyotisha, that is, from 2500 B. C. to 1400 B. C. It was the period of the Taittiriya Sanhita and several of the Brahmanas. The hymns of the Rigveda had already become antique and unintelligible by this time and the Brahmavadins indulged in speculations, often too free, about the real meaning of these hymns and legends, attributing the use of the foamy weapon used by Indra to a compact between him and Namuchi. It was at this time that the S nhitas were probably compiled into systematic books and attempts made to ascertain the meanings of the oldest hymns and formulæ. It was also

during this period that the Indians appear to have come in contact with the Chinese, and the latter borrowed the Hindu Nakshatra system. I do not mean to say that Hindus might not have improved their system by the mutual interchange of ideas as they did when they came to know of Greek astronomy. But the system was decidedly of Hindu origin and of purely Hindu origin being handed down from the remotest or the pre-Orion period in the Vedic literature. M. Biot was unable to assign any reason why the Chinese should have taken a leap from the shoulder to the belt of Orion to choose their fourth sieu. But with the older Hindu traditions the question admits of an easy explanation, as the belt was therein the real Mrigashiras or rather the top of Mriga's head.

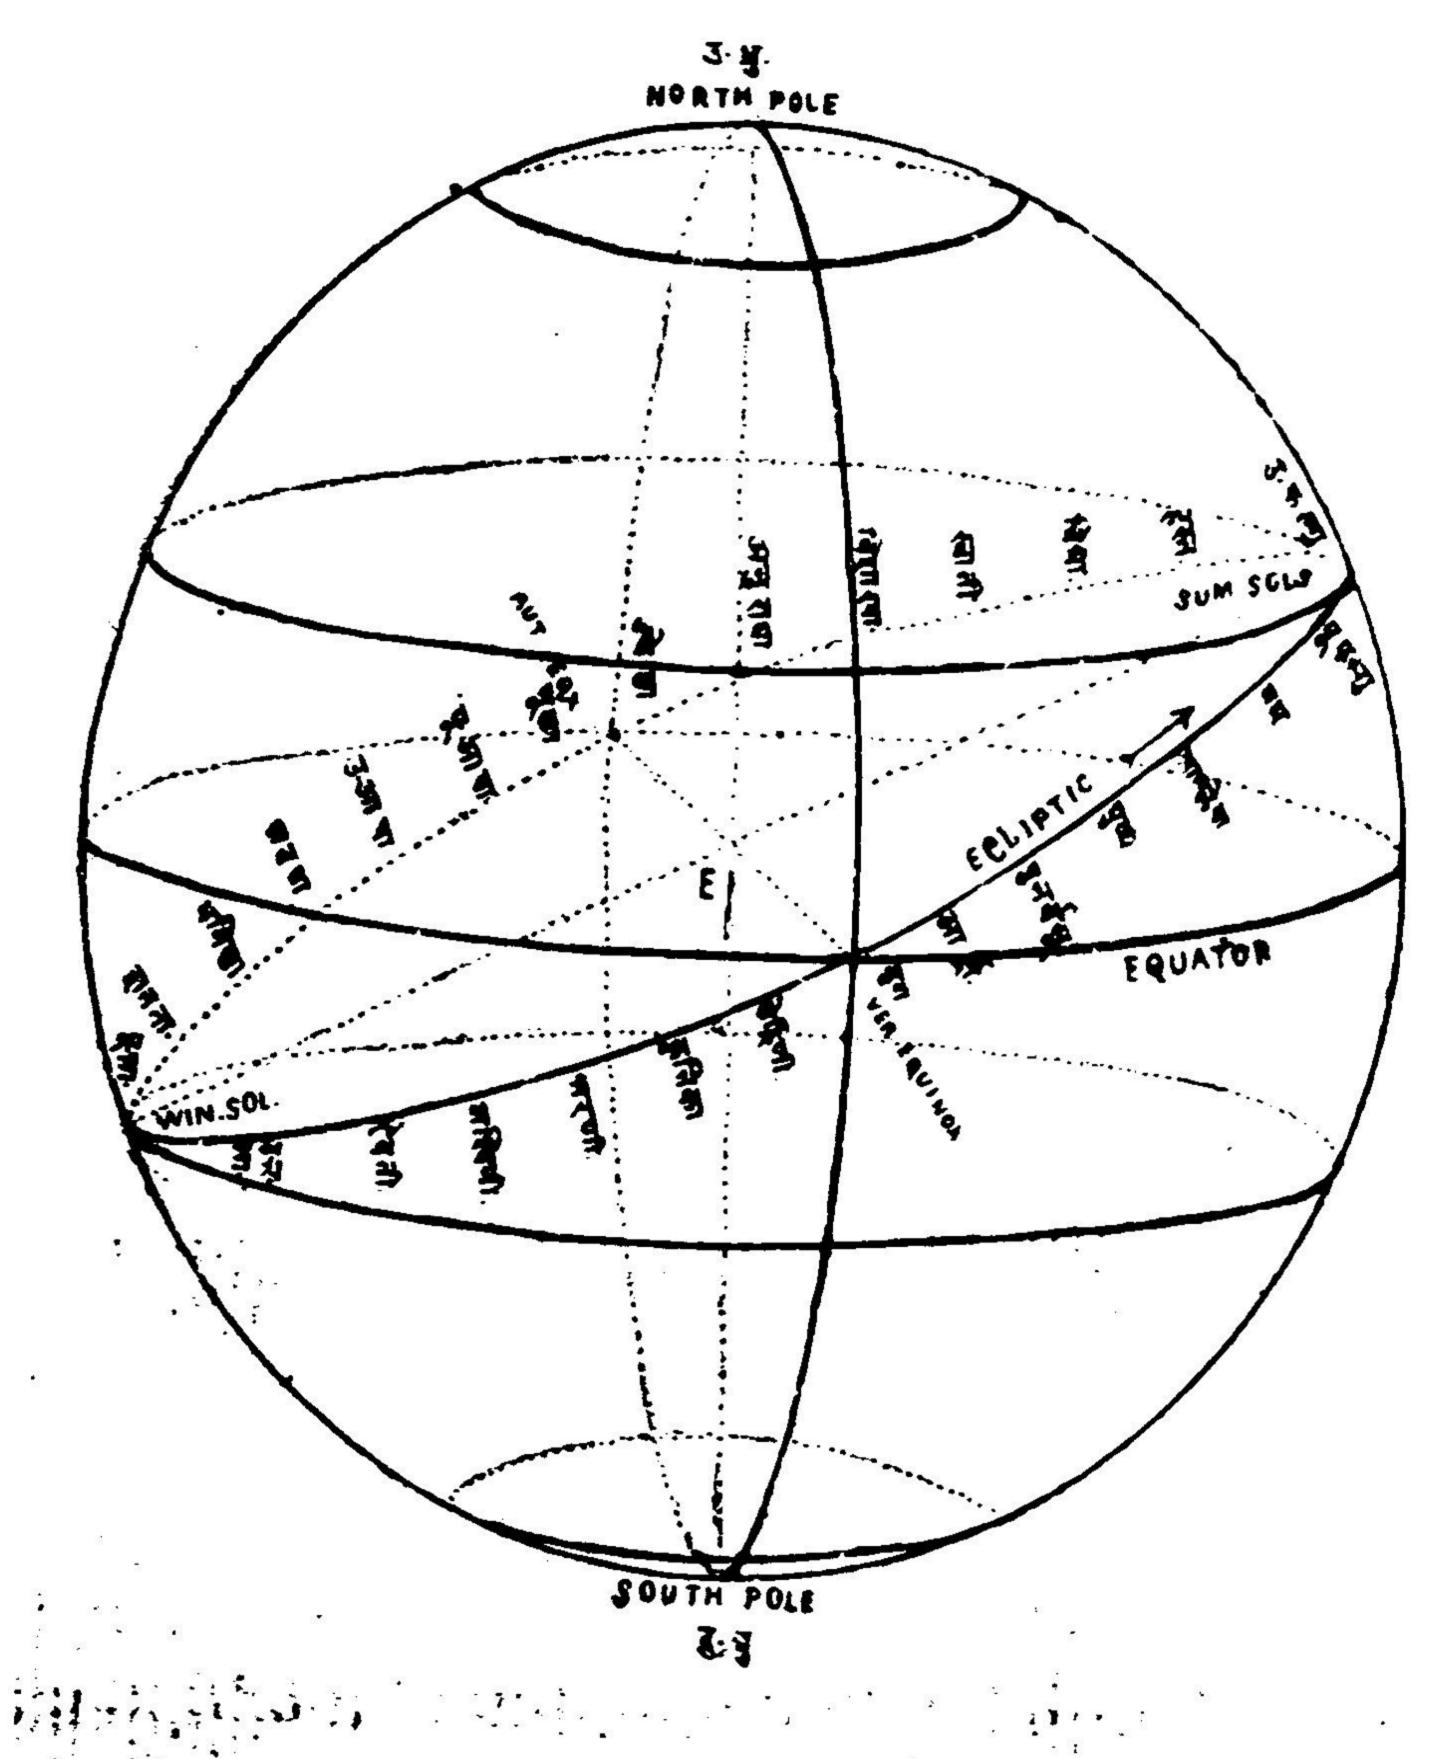

The fourth and the last period of the old Sanskrit literture extends from 1400 B. C. to 500 B. C. or to the birth and rise of Buddhism. It was the period of Sutras and philosophical systems. It may be called the real pre-Buddhistic period. But as this has been sufficiently discussed by other writers I need not go into its further details.

I do not mean to lay down hard-and-fast limits of each of these periods of antiquity, nor do I intend to say anything about the period which must have elapsed before the Vedic Aryas were able to fix their primitive calender in the Aditi period. The beginning of the Aryan civilization must undoubtedly be placed a long time before the people were able to conceive and determine the calender. But I do not wish to enter here into these speculations. I take my stand only upon what we find recorded in the Vedic works, and hence all that I mean is that if the astronomical allusions, references, facts, and legends in the Vedic works can have any meaning, we cannot materially shorten the periods I have here indi-

cated. We may not rely on vague traditional beliefs amongst one nation alone, but when we find that the traditions of India, Greece, and Iran, agree in their important features, and can be explained satisfactorily only by placing the vernal equinox in Orion, and when we have an express authority for doing so in the Rigveda, I do not think that we can reasonably refuse to accept the conclusions deduced therefrom. It is true that we have determined the oldest Vedic periods from the traditions we find recorded in the Rigveda, and, strictly speaking, it is the periods of the traditions and not of the hymns into which they have been incorporated. But this does not, in my opinion, materially affect the conclusions we have arrived at above regarding the ancient period of the Vedic literature. I don't mean to deny that the hymns may not have been sung some time after these traditions and legends were originally conceived, or that after they were first sung the hymns might not have been somewhat modified in form in passing from mouth to mouth before they became settled in the form in which we now possses them. But though so much may be legitimately conceded, I think that it is impossible to hold that the hymns were composed thousands of years after the stories narrated in them were first conceived. For, as a matter of fact, we find that the Rigveda hymns had already become antiquated and unintelligible in the days of the Taittiriya Sanhitâ and the Brâhmanas. The Taittlriya Sanhitâ places the vernal equinox in the Krittikas, and I have shown that we must fix its date at about 2500 B. C. If the hymns of the Rigveda Sanhità were unintelligible at this time, they must have been sung several conturies before it. The comparison of the Taittiriya with the Rigveda Sanhità further shows that while the first mentions three year-beginningsone current and two old—the second only mentions one.

Again, the Rigveda Sanhitâ contains no reference to the Krittikas as the mouth of the Nakshatras. I therefore conclude that the legends in question must have been incorporated into the hymns of the Rigveda, when they were still intelligible, that is, in the Orion period. It is of course impossible to determine the dates of individual hymns. That all of them were not sung at one time is quite evident from their style. Some of the hymns distinctly speak of older hymns or bards, while in Rig. x. 99.9 the hymns are said to proceed directly from the purusha or the sacrificial personage. All that we can therefore legitimately say is that the hymns, which contain older traditions and legends, e. g., of the Ribhus and Vrishakapi, must have been composed in the Orion period. Some of the hymns may even be still older and some later, but generally speaking we may suppose that 4000 and 2500 B.C. are the limits of this period. This may require us to assume the existence of some Vedic verses at a time when the Hindus, the Greeks and the Parsis lived together. Some scholars may hesitate to accept such a conclusion. But so far as I know the conclusion is not inconsistent with the results of comparative Philology or Mythology. Prof. Max. Müller in his Biographies of Words (pp. 188-198) gives a list of about sixty mythological names which may be shewn to be common to Greek and Sanskrit.* If so many mythological names can be shewn to be phonetically identical it is impossible to suppose that no songs, celebrating the deeds of these deities, existed in the Indo-Germanic period. Westphal

For instance Ribhu is compared to Greek Orpheus, Saramâ to Gk. Elenes, Vritra to Gk. Orthros, Dâsahantar to Gk. Deophentes. I have already referred to his suggestion regarding the comparison of Vrishâkapi with Gk. Erikapaeos. If all these deities existed in the Indo-Germanic period, why not their hymns?

Explanation:—The figure is drawn on the supposition that the earth (E) is in the centre, that the sun moves in the Ecliptic, and the precession of the equinoxes is caused by the motion of the Ecliptic. With a given Nakshatra at the vernal equinox, we can here at once find what Nakshatras would be at the other cardinal points and hence also the month at the winter solstice.

has already proved the existence of poetry in the Indo-Germanic period, and Dr. Kuhn has endeavoured to trace whole formulæ back to the beginning of Indo-European poetry. Verbal coincidences such as, Sk. pada, Av. padha, Gk. pous, all meaning a metrical foot, again point to the same conclusion.* The results of comparative Philology, are therefore, not only not inconsistent with, but, on the contrary, corroborate the conclusions we have independently deduced from the astronomical references and allusions recorded in the old Vedic literature. But I would not make my case rest on such grounds. It must be remembered that we have not been speculating in any way about the oldest Vedic periods. Our conclusions have been based on express statements and texts in the Vedic literature and unless the texts themselves are questioned or other more reasonable interpretations suggested, we shall not be justified in disregarding these results, simply because they do not support certain literary hypotheses, guesses, or conjectures, as for instance, those that have been previously referred to in the first chapter. The results of the literary method may be moderate. But moderation is a virtue only when we have to make guesses about the periods of antiquity from uncertain data. Where however we have definite texts and traditions to rely upon, nothing but prejudice can deter us from drawing legitimate conclusions from them on the ground that they take us too far back. The astronomical method, I admit, is vague, in so far as it does not enable us to determine the exact date of all the Vedic hymns or works, but it is certainly superior to the linguistic method inasmuch as it supplies us with certain definite and undisputed facts, for instance, the position

See Dr. Schrader's Pre-historic Antiquities of Aryan Peoples, Part i., Chap. II., pp. 27, 28.

of the equinoxes which can safely be made the nuclei of the different periods of antiquity. When the centres of each period are thus indisputably fixed and determined, we can then use the literary or the linguistic method to supplement these results by determining the duration of each period. There would then be no real opposition between the two methods. The one would determine the specific points of time, while the other would give us the range of the different periods. In other words, the first would supply the piers and the second the arches of the bridge, which we mean to construct across the period of antiquity, and which must therefore be completed with the assistance of both.

It may, however, be urged that if the beginning of the year was twice altered owing to the precession of the equinoxes, how is it that we do not find the traces of the intermediate stages or of the changes in the seasons in the old Vedic works? How, it may be further asked, did the Indian Aryas not discover the precession of the equinoxes in the early Vedic times? But it is not at all difficult to answer these questions. We might as well ask how no one before Bhaskaracharya or Newton ever thought of the attraction of the earth, though since the very beginning of the human race every one observed heavy objects falling down to the surface of the earth. The reason is plain enough. Celestial and natural phenomena cannot be sathomed or understood without a steady and close observation for centuries, and, above all, until all the auxiliary, or rather the whole group of sciences are proportionally developed. If we bear this circumstance in mind, we can, I am sure, discover sufficient traces of the intermediate changes in the Vedic works. Thus we find that of all the ancient

nations the Hiudus alone had well nigh accurately determined the rate of the motion of the precession of the equinoxes. Hipparchus considered it to be not less than 36", while the actual motion at present is 50" 25 per year. Ptolemy adopted, as observed by Prof. Whitney, the minimum of 36' determined by Hipparchus; and it is evident that the Hindu astronomers who fixed the rate at 54" per year could not have borrowed it from the Greeks. Prof. Whitney is at a loss to understand how the Hindus succeeded in arriving at a determination of the rate of motion, so much more accurate than was made by the great Greek astonomer, and he observes that it might be a "lucky hit on their part." But why should they try to hit, even luckily, when they could have easily borrowed it from the Greeks? I am therefore disposed to think that it was independently, and almost correctly, discovered by the Hindus long before other nations could do so, though we cannot exactly fix the period when it was done; and that there were sufficient materials for the purpose in the old literature of India.

Let us next see what traditions about the intermediate stages have been preserved. First of all I refer to the tradition of Rudra killing Prajapati, the god of time, for receding towards his daughter Rohini. The Aitareya Brahmana (iii. 33) describes this conduct of Prajapati as akrita or unprecedented and such as deserved to be severely noticed by the gods. Can we not herein discover the fact that the sun was gradually receding towards Rohini, by the precession of the equinoxes? The ancient priests, who observed the fact as they watched the Nak-

^{*} See Whitney's notes to the Surya Siddhanta, iii. 13., p. 105.

shatras at the commencement of the year, could not account for the change, and they rightly and honestly believed that it was a great calamity that the sun or Prajapati should thus follow an unprecedented course. I have previously referred to a verse from Garga, which says that if the Uttarayana commenced otherwise than from the asterism of Dhanishthâ it foretold a great danger; and we may suppose that the Vedic Aryas similarly believed that if the sun ceased to commence the year from Orion, it was an unpecedented calamity. Prajapati, however, was punished for his unusual conduct, and there the matter ended for the time being. I may also refer here to the ancient mode of deriving the word Rohini. The Arabs called it Al-Dabaran or "the follower" evidently because it came next after the Krittikas.† Bnt the Hindus called it Rohinî, "the ascended" inasmuch as they noticed that the sun gradually ran towards it in oldest days. It has been suggested that we should explain the legend of Prajapati by reference to the daily rising of Rohini, Mrigashiras, and Rudra in succession. But this explanation hardly accounts for the fact why Prajapati was considered as literally running after Rohini in an uuprecedented way. Surely we cannot suppose that the Vedic priests were ignorant of the fixed position of these constellations, and if so, we cannot account for the fact why they considered Prnjapati as running after and thinking of living together with Rohini unless they had noticed the actual recession of the sun towards Rohini owing to the equinoxes. The tradition of Prajapati and Rudra is thus comparatively speaking a later tradition though it seems to have been completely formed before the separation of the Greeks and the Parsis from the Indian Aryas.

^{*} See supra, Chapter II, p. 19.

[†] See Whitney's notes to Surya Sid., viii. 9., p. 185.

But the question, which was dropped at this time after punishing Prajapati, was again taken up when the equinox had receded to the Krittikas. The seasons had fallen back by one full month and the priests altered the year-beginning from the Phalguni to the Magha full-moon, while the list of the Nakshatras was made to commence from the Krittikas, instead of from Agrahâyana. There is nothing surprising in the fact that the change should have been quietly introduced when we see that Varâhamihira did the same in the fifth century after Christ when the Ashvinî system was introduced. The calendar was mainly used for the sacrificial purposes, and when the priests actually obserxed that the sun was in the Krittikas, and not in Mrigashiras, when day and inight were equal, they altered the commencement of the year to the Krittikâs, especially as it was more convenient to do so at this time when the cycle of seasons had receded by one full month. The priests knew that the year commenced a month earlier in older days, but like Varâhamihira they must have appealed more to the actual facts, as they saw them, and introduced the change without attempting to discover its real cause.

The Vedânga Jyotisha introduces the third change, when the seasons had further fallen back, not by a month, but by a fortnight. It was probably during this interval that the beginning of the month was altered from the full-moon to the new-moon, and when this beginning of the month was so altered, advantage was taken of the receding of the seasons by a fortnight, to commence the year with the new-moon in Dhanishthâ as the Vedânga Jyotisha has done.

From this the next recorded step is to Ashvinî. There is, however, an interesting story related in the Mahâbhârata

^{*} See supra Chap. III. p. 36.

which evidently refers to an abortive attempt to reform the calender when the seasons had again fallen back by a fortnight. In the 71st chapter of Âdiparva we are told that Visvâmitra attempted to create a new world, and make the Nakshatras commence with Shravana, instead of Dhanishtha; and the same story is alluded to in the Ashvamedha Parva, chapter 44. The tradition can also be found in other Purânâs where Visvâmitra is represented as endeavouring to create a new celestial sphere. It appears, however, that he did not succeed, and the Krittika-system, as modified by the Vedânga Jyotisha, continued to regulate the calendar until the list of the Nakshatras was quietly made to begin, as noticed in the third chapter, with Ashvini in later times.

We have thus an almost continuous record of the year-beginnings from the oldest time down to the present in the literature of India, and in the face of this evidence it is use-less to indulge in uncertain speculations about the antiquity of the Vedas. I have already referred to the occurrence of the pitri-paksha in Bhâdrapada as a relic of the time when the year commenced with the Phalguni-full-moon. Our Shrâvani ceremony appears to have been once performed in Bhâdrapada (Manu iv. 95); and as it marked the beginning of the rains, when the herbs appear anew (Âshvâlâyana

चकारान्यं च छोकं वै कुद्धा नक्षत्रसंपदा। प्रतिभवणपूर्वाणि नक्षत्राणि चकार सः॥

and again in the Ashv. 44. 2.

अहः पूर्वे नतो रात्रिः मासाः ग्रुक्कादयः स्मृताः । अवणदीनि ऋक्षाणि ऋतवः शिशिरादयः ॥

^{*} Mahâ. Adi. 71, 34.

Grihya Sûtra iii. 5, 2), we can here trace the recession of the rainy season from Bhâdrapada to Shrâvana and from Shrâvana to Ashâdha (Sânkhyâyana Brâhmana i. 3) and finally from Ashâdha to Jyeshtha, as at present, thus fully correborating the recession of the beginning of the year or the winter solstice from Chaitra to Phâlguna, from Phâlguna to Mâgha, and from Magha to Pausha. The evidence of the recession of the seasons is not, however, as complete as that of different year-beginnings, inasmuch as there are various local causes besides the precession of the equinoxes that affect the ocurrence of the seasons. The seasons in the Central India and Central Asia cannot, for instance, be the same, and if the Aryas came into India from the North-West, the very change of locality must have caused a corresponding change in the seasons. The evidence of the change of seasons cannot therefore be supposed to be so reliable and conclusive as that of the successive changes in the beginning of the year above mentioned.

Lastly, there remains only one question to be considered. Is the Vedic period here determined consistent with the traditions and opinions entertained about it by the ancient and modern scholars? I think it is. I have already referred to the remarks of Prof. Weber who, though he regards the Krittika evidence as vague and uncertain, yet on geographical and historical grounds arrives at the conclusion that the beginnings of the Indian literature may be traced back to the time when the Indian and the Iranian Aryas lived together; and this opinion is confirmed by the fact that there are Yashts in the Zend Avesta which may be considered as "reproductions" of the Vedic hymns. Dr. Haug considers that this condition may be satisfied if we place the beginning

of the Vedic literature in 2400 B.C;* but he was not cognisant of the fact that the vernal equinox can be shown to have been in Mrigashiras at the time when the Parsis and the Indians lived together. In the light of this new evidence, there is therefore no reasonable objection for carrying the periods of the Vedic literature further back by over a thousands years or to about 4000 B. C. This period is further consistent with the fact that in 470 B. C. Xanthos of Lydia considered Zoroaster to have lived about 600 years before the Trojan War (about 1800 B. C.); † for according to our calculation the Parsis must have separated from the Indian Aryas in the latter part of the Orion period, that is to say, between 3000 to 2500 B. C; while, if we suppose that the separation occurred at a considerably later date, a Greek writer in the fifth century before Christ would certainly have spoken of it as a recent event. Aristotle and Eudoxus have gone still further and placed the era of Zoroaster as much as 6000 to 5000 years before Plato. The number of years here given is evidently traditional, but we can at any rate infer from it this much that at the time of Aristotle (about 320 B. C.) Zoroaster was considered to have lived at a very remote period of antiquity; and if the era of Zoroaster is to be considered so old, a fortiori, the period of the Vedas must be older still. Then we have further to consider the fact that an epic poem was written in Greek in about 900 or 1000 B. C. The language of this epic is so unlike that of the Vedic hymns that we must suppose it to have been composed long time after the Greeks left their ancient home and travelled westward. It is not, therefore, at all improbable that they separated after the formation of the legends

^{*} Dr. Haug's Intr. to Ait. Br., p. 48. † See Dr. Haug's Essays on Parsis, p. 298.

of Orion and before the vernal equinox was in the Krittikas, that is, between 3500 to 3000 B. C. Finally we can easily understand how the acutest and most learned of Indian theologians and scholars believed the Vedas to have come down to them from an unknown period of antiquity. A revelation need not necessarily be anâdi, or without a beginning. The history of the Bible and the Koran shows us that a revelation can be conceived to be made at a particular period of time. If so, the mere fact that it is believed to be revealed does not account for the opinion entertained by the Hindu theological writers that the Veda has come down to them from times beyond the memory of man. Some of these writers lived several centuries before Christ, and it is quite natural to suppose that their opinions were formed from traditions current in their times. The periods of the Vedic antiquity we have determined render such an explanation highly probable. According to the Christian theology, the world was created only about 4000 years before Christ; or, in other words, the notions of antiquity entertained by these Christian writers could not probably go beyond 4000 B. C., and not being able to say anything about the period preceding it, they placed the beginning of the world at about 4000 B.C. The Indian theologians may be supposed to have acted somewhat in the same manner. I have shewn that the most active of the Vedic period commenced at about 4000 B. C., and there are grounds for carrying it back still further. The form of the hymns might have been more or less modified in later times; but the matter remained the same, and coming down from such a remote antiquity it could have been easily believed by Jaimini, Pânini, and the prahmâvadin of old to have been in existence

almost from the beginning of the world, or rather the beginning of all known things. We can thus satisfactorily account for all the opinions and traditions current about the age of the Vedas amongst ancient and modern scholars in India and in Europe, if we place the Vedic period at about 4000 B.C, in strict accordance with the astronomica references and facts recorded in the ancient literature of India When everything can thus be consistently explained, I leave it to scholars to decide whether the above period should of should not be accepted as determining, as correctly as it i possible to do under the circumstances, the oldest period of Aryan civilization. It is the unerring clock of the heaven that has helped us in determining it, and it is, in my opinion hardly probable to discover better means for the purposes The evidence was in danger of being obliterated out of the surface of the heavens, when the Greeks borrowed their astronomical terminology from the Egyptians. But it ha fortunately escaped and outlived, not only this, but also another threatened attack when it was proposed in England and Germany to name the constellation of Orion after Nelso or Napoleon as a mark of respect for these heroes. The bold and brilliant Orion, with his attendant Canis, preserves for u the memory of far more important and sacred times in th history of the Aryan race.

APPENDIX.

Agrayana and Orion.

I have already stated in brief my reasons for provisionally identifying Sk. Âgrayana with Gk. Orion, and here I wish to examine the point more fully, not because my case rests upon it, but simply with a view to indicate the real nature of the objections that may be urged against the proposed identification. If philologists are still inclined to hold that the identification is not even probable, we shall have to look for some other Aryan derivation, as the similarity of the Eastern and Western traditions of Orion is, in my opinion, too strong to be accidental.

Agrayana is evidently derived from agra and ayana. Of these ayana, which is derived from i, to go, may be represented by ion in Greek: cf. Sk. ayus, Gk. aion Sk. comparative termination (nom. sin.) îyán Gk. iōn; Sk. termination âyana, as in Gargyâyana, Gk ion, as in Kronion, 'the descendant of Kronos'. The initial a in Sk. Agrayana may also become ō in Greek; as in Sk. āshayana, Gk. ōkeanos; Sk. àshu Gk. ökus. Sanskrit Agrayana may therefore be represented by Ogrion in Greek, and we have now to see if g may be dropped before r and Ogrion can be changed into Orion. It is a general phonetic rule in Teutonic languages that a gutteral may disappear before a liquid, whether initially or medially; cf. Ger. nagel, Eng. nail; hagel and hail; regen und rain; Sk, kravis, O. H. G. ro. Prof. Max Müller has extended the application of this rule to Latin and Greek, and Latin and French in his Lectures on the Science of Language, Vol. II., p. 309. He compares Latin paganus vith French paien, Gk. láchne' With Lat. lána; and points

out that on the same principle lumen stands for lucmen. examen for exagmen, flamma for flagma. K. Brugmann (Com. Gr. I., § 523.) would derive O, Ir. ar, Cymr. aer from *agro on the same principle. This shews that 8k. agra may be easily represented by ar in Teutonic languages. We may account for the change in two ways. We may either suppose that the final gutteral of a root is sometimes dropped before terminations beginning with a liquid and thus put luc-nien = lu-men, fulg-men = ful-men, flag-men = fla-men, $ag-men = \tilde{a} \cdot men$, $ag-ra = \tilde{a} \cdot ra$ (with compensation vowel lengthening; Bopp derives Sk. roman, a hair from ruh-man growing, on the same principle); or we may suppose that the change is in accordance with general phonetic rule which sanctions the omission of a gutteral before a liquid in such cases. But which soever explanation we adopt, there no question as to the change itself. It must not, however, be supposed the rule is an uninflexible one, and that a gutteral must always be dropped before a liquid; for we find that gutteral in such cases is often either retained or labialised. cf. Sk. gravan, O. Ir. broo, bro, (gen. broon), Cymr. breuan; Sk. grinami, Q. Ir. gair. The proper rule to deduce from these instances would therefore be, that gr in Sanskrit may be represented by gr, br or r in Teutonic languages, and that all the three changes are possible.

can we not extend the rule to Greek and Sanskrit?—
is the next question we have to consider. I do not mean to
deny that there are phonetic rules which are not universally applicable to all languages. But the present rule can
be easily shewn not to belong to this class. Prof. Max
Müller has already extended it to Greek and Latin and

Vararuchi, in his Prakrita Prakasha II. 2, lays down that g in ga may be medially dropped as between Sanskrit and Prakrit, e.g., Sk. sâgara, Pk. sâ-ara; Sk. nagara, Pk. na-ar, eventually corrupted into nara, as in Jun-nara and other names of cities. This is, in fact, the same rule which, when applied to Teutonic languages, accounts for the change of segel into sail, nagel into nail and so on. Comparison of Avestic tigra with Mod. Per. tir shews that a similar change may also take place between those languages. We may, therefore, fairly say that the rule about the omission of gutteral before a liquid obtains not only in Teutonic languages, but also between Greek and Latin, Latin and French, Sanskrit and Old Irish, Sanskrit and Prakrit, and Avestic and Modern Persian. In the sace of these facts it would, I think, be unduly restricting the applicability of the phonetic rule if we refuse to apply it to Sanskrit and Greek. There is at any rate no a priori improbability in expecting that a similar change may take place as between Greek and Sanskrit. Let us now see if there are any instances as between Greek and Sanskrit to support such a conclusion.

Prof. Bensey compares Sk. gravan with Gk. laos (Lat. lapis); and Sk. ghrâna with Gk. ris, rinos. If this comparison is correct, here at least we have two instances where a gutteral before r in Sanskrit is lost in Greek. It is sometimes labialised, as in Sk. krînami, Gk. priami; Sk guru, Gk. barus; and sometimes retained as it is, as in Sk. kratu, Gk. kratus; Sk. gras, Gk. grao, to swallow. From these instances we may therefore infer that as between Greek and Sanskrit, the initial gutteral in kr or gr in Sanskrit may be either retained as it is, or labialised or dropped in Greek,—the same rule which holds good, as shewn above,

in Teutonic languages. It may be noticed here that while gravan becomes laos in Greek, it is broon in Old Irish, that is, while the initial g of a Sanskrit word is labialised in Old Irish it is dropped in Greek. This shews that the initial kr or gr in Sanskrit may be differently represented in different languages. Sanskrit krimis, Lat. vermis, Gk. elmis, and Sk. klipta, Avestic kerepta, Gk. raptos, may, I think, also be regarded as further illustrations of the same rule. I know that the connection between the words last quoted is still considered doubtful, but that is because the rule about the omission of a gutteral before a liquid, as between Greek and Sanskrit, is not yet recognised by scholars. If the examples I have given at the beginning of this paragraph are, however, sufficient to justify us in applying the rule to Greek and Sanskrit, the instances last cited may be taken as further supporting the same view.

With these instances before us, it would be unreasonable to deny that the three possible changes of kr and gr, which obtain in Teutonic languages, do not take place as between Greek and Sanskrit, at least initially; and if these changes take place initially, analogy at once suggests that they would also take place medially. At any rate there is no reason why they should not. It may be urged that a comparison of Sk. chakra with Gk. kuklos shews that a medial kr is retained as it is. But as pointed out above the argument is not conclusive. I here may be cases where kr is retained as it is. But we have seen that by the side of such cases, instances can be quoted where it is changed to pror rinitially; and we may expect the same threefold possible change medially. It is admitted that labialisation takes place medially; and we have therefore to see if there are any instances where a gutteral is dropped before a liquid in the body of a word. K. Brugmann tells us that

at one period gn and gm came to be represented by n and m in Greek; cf. gignomai and ginomai, stugnos and stunos. Now this change in the budy of a word is exactly similar to that of agmen into amen, and is evidently due to the same rule, which accounts for the latter change. Similarly Gk. anoos may be compared with Sk. ajna, and Gk. arinos to Sk. aghrana. But I do not lay much stress on these inasmuch as these words may be supposed to have been derived by the addition of the prefix alpha to the already existing Greek forms, and not directly obtained from Sanskrit ajna and aghrâna. The change of gignon ai into ginomai or of gignosko into ginosko cannot, however, be so accounted for, and if g before n is dropped in the body of a word, there is no reason why it should not be dropped before r on the analogy of the phonetic rule given above. Works on philology do not give any more instances of such changes, but as observed above, the attention of scholars does not appear to have been directed to this point. Otherwise I do not think it was difficult to discover the similarity between Gk. turos and Sk. takra. Takra is derived from tanch (*teng) to contract, to coagulate or curdle, and according to Fick the root is Indo Germanic. It is an old Vedic root, and we have such expressions as dadhnâ âtanakti 'coagulates (milk) with curds' in the Taittiriya Sanhitâ II. 5. 3. 5. Takra therefore literally means 'curdled milk' and not 'curds mixed with water' as the word is understood in modern Sanskrit. Now, if we suppose that the rule, which sanctions the omission of g or k before r or m in other languages, also holds good as between Greek and Sanskrit, not only initially (as in gravan and laos) but also medially, as in gignomai and ginomai, Sk takra may be easily identified with Gk. turos meaning 'cheese'. Takra may thus be said to have retained its root meaning in Greek.

Turos is an old Greek word used in the Odyssey, and it has not yet been explained by anything in Indo-Germanic. Dr. Schrader therefore records a suggestion that it should be derived from Turko Tataric turak. But if Sanskrit sara and sarpis are found in Greek oros (whey) and elphos (butter,) it is not reasonable to suppose that turos alone was borrowed from a non-Aryan source. Takra in modern Sanskrit means 'curds mixed with water and churned' and perhaps it may be contended that we cannot identify it with turos, which means 'cheese.' I have, however, shewn that takra etymologically means 'curdled milk' and not 'curds dissolved in water' which is evidently its secondary meaning. Besides when we see that sara which in Sanskrit denotes 'curdled milk,' has become oros = whey in Greek, and serum in Latin, there is nothing unusual if we find takra and turos used in slightly different senses in the two languages. I have already suggested in the body of the essay that we may identify Sk. Shukra with Gk. Kupris. Chakra = kuklos, Shukra = Kupris, and takra = turos, may thus be taken to illustrate the application of the rule above discussed, regarding the three-fold change of kr or gr, to Greek and Sanskrit medially; and instances have been already quoted to show that the rule holds good initially as between Greek and Sanskrit. We may therefore conclude that the change of gignomai into ginomai is not a solitary instance, and that as a general rule g may be dropped, labialised or retained before a liquid as between Greek and Sanskrit whether at the beginning or in the body of a word. We might even discover further instances of the applicability of this rule; for, if takra is thus correctly identified with turos, we may, on the same principle, identify Sk. agra with Gk. cros, meaning top summit. It was impossible to represent Sanskrit agra by a separate Greek word otherwise. It could not be represented by agros in Greek as the latter word corresponded to Sk. ajra, a field; nor can agra be changed to akris which represented Sk. ashri. Sanskrit agra, therefore, naturally came to be represented by oros. Oros, meaning top or summit, has not yet been satisfactorily derived in any other way.

It will be seen from the above that we have sufficient grounds to hold that the rule about the omission of a gutteral before a liquid, whether initially or medially, applies to Greek and Sanskrit in the same way as it does to other languages; and if so, Sk. Agrayana can be represented by Orion in Greek.

I have already quoted Brugmann to show that agra becomes ar or aer in Teutonic languages. Now further comparing Lat. integru, integer with Fr. entier; Gk. dakru, Goth. tagr with Eng. tear; pagan with paien and regen with rain, we are led to infer that where k or g is dropped before r or a liquid we may expect two contiguous vowels, probably because this gr is at first optionally altered into ger or gar. We can now understand why Orion was sometimes spelt as Oarion; and the existence of this double form confirms, in my opinion, the derivation above suggested. As for Orion alone we might derive it from oros, limit, or āra, spring, and ion, going thus, giving the same meaning, viz., the limit or the beginning of the year or spring, as Agrayana in Sanskrit. But this does not account for the double form—Grion and Oarion—unless the latter be taken for a poetic or a dialectic variation of Orion. I therefore prefer to derive the word from Sanskrit Agrayana.
